Switch to simple – with Klippon® Relay

High-quality relays with unique all-round service

Whether switching, separating, amplifying, or multiplying: relays perform a multitude of different tasks in industrial applications. They have very specific characteristics and are available in almost innumerable varieties on the market.

Klippon® Relay from Weidmüller makes your choice easy. Our worldwide unique all-round offer combines maximum relay variety with matching accessories and first-class service. We provide you with high-quality products that have been thought out down to the smallest detail, combined with comprehensive support from product selection to modern data services. Only with Klippon® Relay can you be sure to get the right relay for your specific needs – and save time and money. That's our promise!

Simply selectable

We offer you comprehensive support in choosing the right product, support you in selecting accessories, and provide tips for installation and maintenance. This saves time and gives you the security of getting the perfect product for each specific application.

Simply reliable

Our support enables you to obtain optimally dimensioned relay products for your application within a very short time. This way you can reliably avoid unnecessary machine and system damage and reduce downtimes to a minimum.

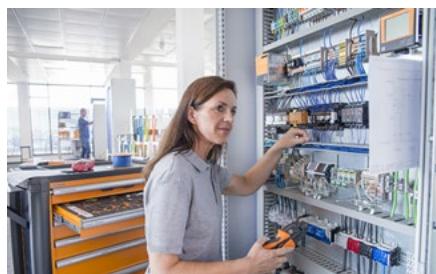

Simply safe

Klippon® Relay products ensure comprehensive operational safety. Whether large temperature ranges, strong vibrations, fast switching cycles, certain safety requirements, or specific standards and directives: You can get a suitable solution for every environment.

Simply maintainable

With Klippon® Relay you can significantly reduce your maintenance effort. Optimum marking options, clear status displays, consistent product labels, connection markings, and much more make your work easier, faster, cheaper, and safer.

Simply efficient

Klippon® Relay products are easy, fast, and convenient to install. The PUSH IN technology shortens wiring times. And our fully assembled and tested relay KITs save time during installation and commissioning.

Simply profitable

Many products in our Klippon® relay portfolio have multi-voltage inputs, which reduces the width of your stock. Our pre-assembled relay KITs save you even more logistics effort by speeding up material management, storage, and retrieval.

Solutions for more productivity

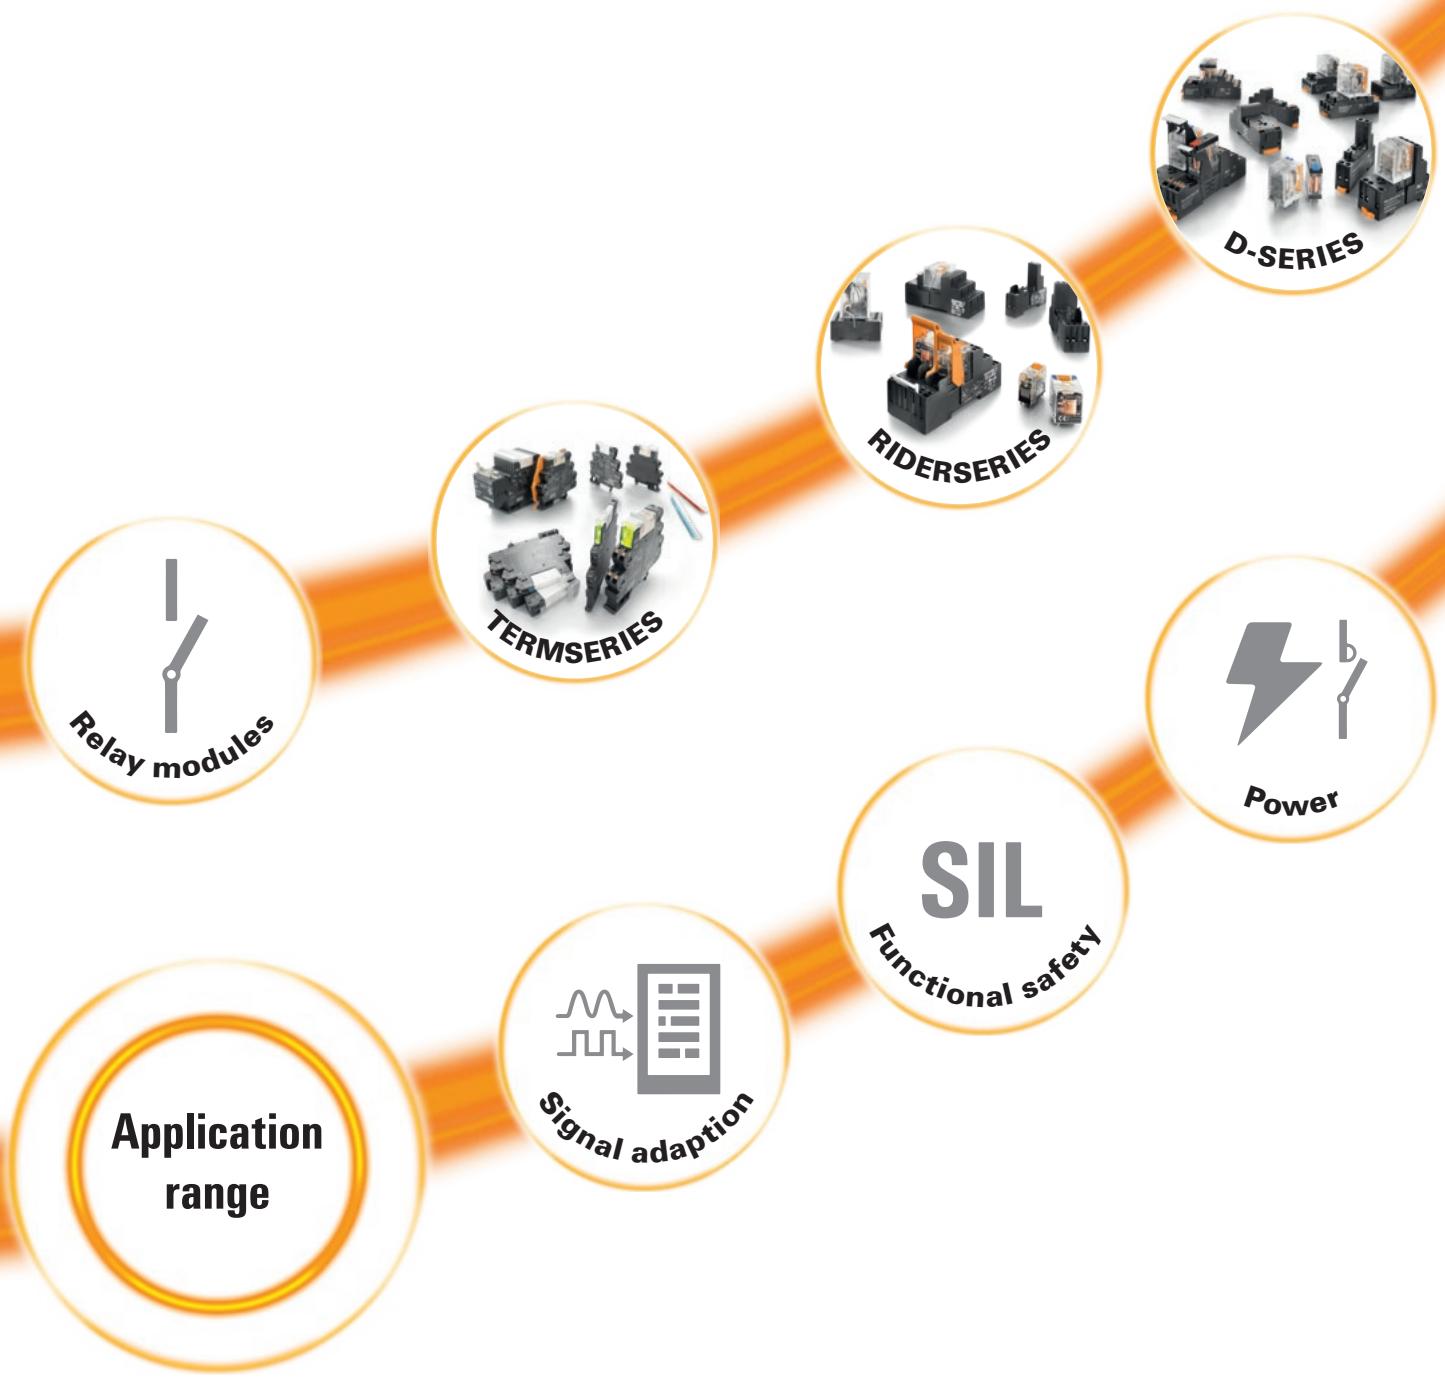

Highly flexible design processes – with Klippon® Relay

For more than 40 years, we have specialised in the optimisation of cabinet infrastructures. Our wide range of relay modules, solid-state relays and additional value-added services combine the highest standards with ultimate quality. Less wiring effort, housing optimisation through space saving, optimal marking and cost reductions – our customers challenges are our motivation.

Our assortment impresses through reliability, longevity and safety. Supplemented by our digital data support, switching load consulting and online selection guides, we support our customers throughout the entire work process – from the planning phase to installation and operation.

In our universal range, you will find an extensive portfolio of relay modules and solid-state relays in various designs.

In our application range, you will find a tailor-made portfolio of products to increase your productivity and safety for various fields of application.

Reliable switching of industrial loads and safe separation and multiplication of signals

With our high-performance relay modules and solid-state relays

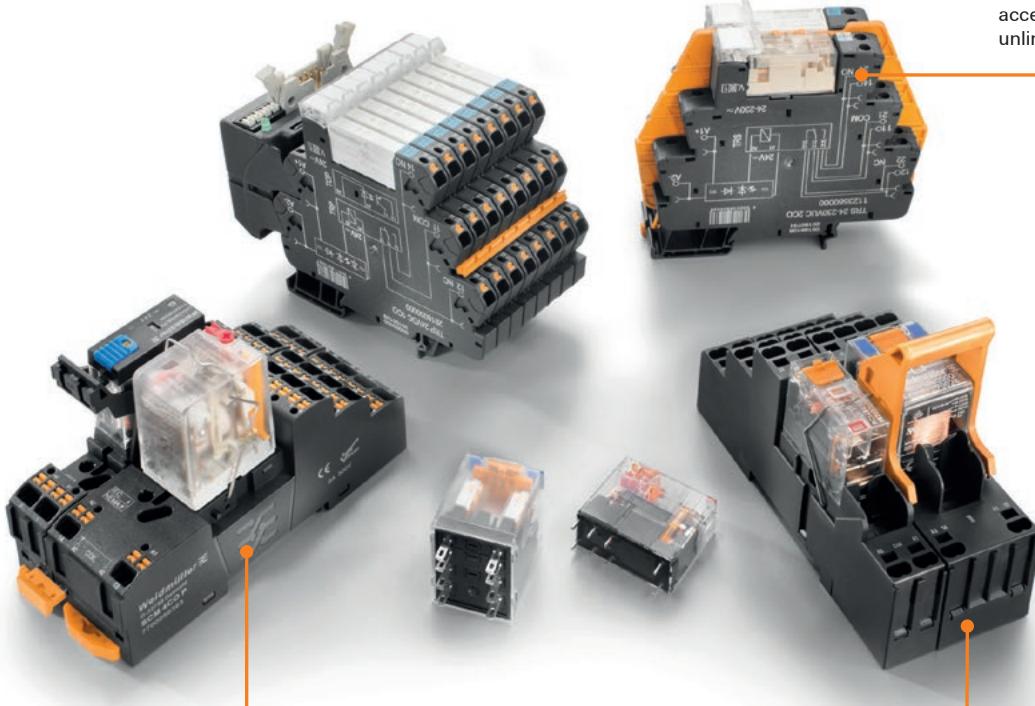

Universal range

Relay modules

For switching and amplifying digital signals in automation technology and for galvanic isolation.

TERMSERIES

The all-rounder. Modular relay modules from 6 mm width with extensive accessories, large selection of variants and unlimited cross-connection possibilities.

D-SERIES

The industrial relay modules with innovative features, an extensive range of variants and a wide assortment of designs for a variety of applications.

RIDERSERIES

High-quality universal relays with many sophisticated details and international approvals in different designs for industrial applications.

Solid-state relays

For wear-free switching and amplification of digital signals in automation engineering.

Reliable switching of industrial loads and safe separation and multiplication of signals

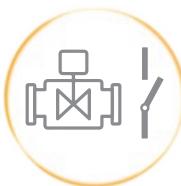

With our high-performance relay modules and solid-state relays

Application range

Timing functions

Timing relays are used in automation technology to compensate for errors due to short cycle times.

Special loads

Relays to switch and monitor special loads, such as inductors and high inrush currents, safely and reliably.

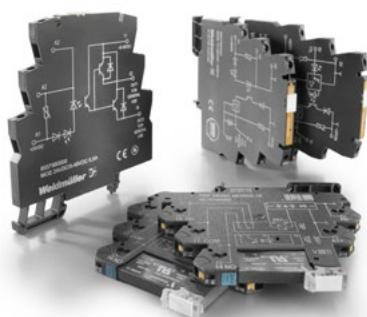

Sensor isolation

Space-saving and fast switching coupling elements to decouple sensors from the field.

**High switching frequencies**

Specially designed solid-state relays for reliable and fast decoupling of signals up to 550 kHz.

**Signal adaption**

Adaptation of signals and their transmission from other systems to the control cabinet level.

**Functional safety**

Specific safety relays required for signals in process safety-related systems.

**Power**

Power solid-state contactor up to 75 A and miniature contactors up to 30 A.

Digital configuration – direct requests

Efficient engineering with the Weidmüller Configurator

Whether product selection, project planning, automated production or installation: consistently available data models are a cornerstone of digitalised development and production processes. They require standardised product data and interfaces between the interlinked engineering tools as well as integration into the company's IT network.

With the Weidmüller Configurator (WMC) we offer you the ideal basis for efficient product development. Speed up your panel planning by up to 70% and increase your overall productivity. Benefit from extremely high levels of data transparency and availability throughout your entire engineering process.

Integrated digital planning – quick and easy

Provision of intelligent item data

The product data from the Weidmüller Configurator supports you during project planning and can be fully integrated into all common engineering tools. You achieve complete data transparency and availability in all process steps – the basic requirements for Industry 4.0 in panel building.

Always the right configuration

The automatic filter function makes it easier to put together suitable relay combinations. Selection errors are corrected automatically, so that only suitable accessories can be included in the configuration. This makes planning easier, saves time and enables complete documentation of the terminal rails.

Reliable and simple marking

The Weidmüller Configurator makes continuous marking easier. Thanks to direct interfaces to CAD programs and the M-Print® PRO marking software, you can plan and mark your components in a single step.

Quick and easy product requests

Once the components have been put together, you can request them directly from the Weidmüller Configurator – either as individual components or as a pre-assembled complete solution on a terminal rail that can be installed directly on the mounting plate.

Basics for relay module selection

A

Electromechanical relays are a varied and cost-effective solution for a wide range of switching processes. They can be used for level and power adaptation and form interfaces between control, signalling and regulating equipment and peripherals. In spite of rising raw material prices, they are still very inexpensive and can be easily integrated into a wide variety of circuit types.

Relay modules from Weidmüller are extremely reliable, durable, and available in many different designs. The diversity of their applications in the various industrial sectors makes it necessary to select a suitable relay for each specific application. The following applies: Due to their design, relay modules are subject to mechanical and electrical wear, which must be taken into account when relay circuits are set up.

EN 60947-4-1 and EN 60947-5-1 describe various industrial reference loads such as resistive, capacitive, and inductive loads that stress the switching contact of a relay modules more or less. Electrical loads are formed out of a mixed load with ohmic, capacitive, and inductive load shares, though in practice, loads with a large inductive load share are used mostly. These include contactors, solenoid valves, motors, etc. We will take a closer look at these areas of application in the following.

AC3 DC1
AC1 DC13
 AC15 EN 60947

Switching of large AC loads

If large AC loads are switched, the relay can in principle be operated until the specified maximum value of switching voltage, current, or power is reached. However, when switching AC loads, the switching voltage has a much smaller influence on the service life of the relay contact than the switching current. The reason for this is that the arc that occurs when the relay is switched off usually extinguish automatically at the next zero crossing of the load current. In applications with inductive loads, an effective protective circuit should be provided, as otherwise a significantly reduced service life can be expected.

Switching of large DC loads

Relays can only switch off relatively small direct currents because the zero crossing for extinguishing the arc is missing here. The maximum direct current value is also dependent on the switching voltage as well as on design conditions such as contact gap and contact opening speed. Corresponding current and voltage values are documented in load limit curves.

With undamped inductive DC loads, these values are lower because the energy stored in the inductance can ignite an arc that carries the current through the open contacts. The resulting arc significantly reduces the service life compared to an resistive load.

An effective contact protection circuit can increase the service life of the contacts by 5 to 10 times compared to inductive loads that are not or unfavorably protected. Type 1N4007 freewheeling diodes are preferably suitable for this purpose.

Switching of utilization categories according to EN 60947

When selecting the relay, the maximum breaking capacity for AC loads and the DC breaking values taken from the load limit curves provide only rough reference values. In practice, however, this is not sufficient because real loads in industrial applications predominantly have inductive or capacitive load shares. Those variables can result in very different values for the service life. To avoid these disadvantages, the contactor standard EN 60947 divides the loads into different use categories, such as DC-13 or AC-15. The standard is also partly applied to relays. However, users must be aware that these values are only partially suitable for practical use since all DC-13 and AC-15 test loads are highly inductive and operated without a protective circuit. More precise statements on switching capacity and service life can be given based on specific application data. The more extensive the data collection, the more accurately the service life can be estimated for the respective applications and, if necessary, optimisation suggestions made. For critical applications, the users should determine the service life values themselves.

Switching of small resistive and inductive loads

Selection table for signal relays

The table below helps you to select suitable relay modules for the specified loads. A service life of around 100,000 switching operations is assumed.

Suitable KITs are available for all series on this page.

Power relay (miniature contactor) with double contact opening for switching industrial loads < 8.5 A.

Additional information on the selection tables

Simple formulas for calculating individual values

Calculating the service life of the relay contacts for different switching currents

In the previous tables we gave you the maximum recommended currents at various loads for a service life of approx. 100,000 switching cycles. If you switch lower currents, the service life of the relay contacts will be extended. With the following formulas you can approximately calculate how the service life of the relay contacts will change.

Example: A 24 V DC solenoid valve with 200 mA current consumption should be switched with a 6.4 mm wide TERMESERIES RSS 1 CO relay. A solenoid valve corresponds to a DC13 load. According to the table, a switching current of max. 1 A is specified for the relay at this load. To calculate the expected service life, proceed as follows:

$$x = \frac{I_{\text{Table}}}{I_{\text{App}}} = \frac{1 \text{ A}}{200 \text{ mA}} = 5$$

$$n_{\text{new}} = 100.000 \cdot x = 100.000 \cdot 5 = 500.000 \text{ switching cycles}$$

The expected service life when switching a 200 mA solenoid valve should be approx. 500,000 switching cycles.

I_{App}	= Switching current in the application
I_{DC}	= DC Switching current at the DC switching voltage in the application
$I_{\text{Load curve}}$	= DC Switching current from the load limit curve of the data sheet
I_{Nom}	= Continuous current from relay data sheet
I_{Table}	= Switching current from the selection table for the respective load
n_{new}	= Service life at switching current in the application
x	= Reduction factor of the switching current

Calculating the switching currents for voltages that deviate from the values in the table

AC switching voltage:

With AC loads, the switching current has the greatest influence on the service life. Therefore, the switching currents from the table can also be used for switching voltages up to 100 V AC. For values below 100 V AC, the service life increases at the same switching current:

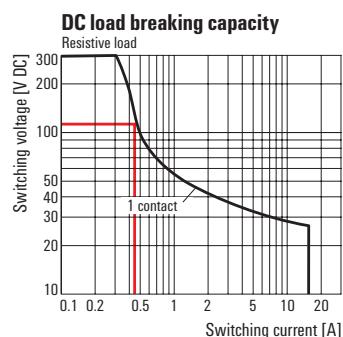

- at 24 V AC four times the service life
- at 60 V AC twice the service life

Example: If the table shows a switching current of 2 A for a 250 V AC AC15 load, then these 2 A are also applicable for 120 V AC. At 24 V AC switching voltage, the expected service life increases four times to 400,000 switching cycles.

DC switching voltage:

When switching DC loads, the switched voltage has a large influence on the maximum switching current of the relay contact. This can also be seen from the DC load breaking curve given in the data sheet. The following formulas can be used to roughly determine the maximal switching current for other DC switching voltages:

Example: A TERMESERIES RCL 1 CO relay with a DC13 load and a switching voltage of 110 V DC. According to the table a maximum of 2 A at 24 V DC applies to a DC-13 load for a service life of 100,000 switching cycles.

The curve shows a maximum switching current of approx. 0.45 A with resistive load. This must now be set in relation to the rated current of the relay (16 A) from the data sheet and the value for a DC13 load from the table.

$$x = \frac{I_{\text{Table}}}{I_{\text{Nom}}} = \frac{2 \text{ A}}{16 \text{ A}} = 0.125$$

$$I_{\text{DC}} = I_{\text{Load curve}} \cdot x = 0.45 \text{ A} \cdot 0.125 = 0.056 \text{ A} = 56 \text{ mA}$$

To achieve 100,000 switching cycles, a DC13 load of 56 mA can be switched with a switching voltage of 110 V DC.

Select contact materials suitable for the application

Information of various contact materials

Relay modules are used in a wide variety of industrial areas and environments. The relays must therefore be adapted to the various tasks by selecting suitable contact materials. The following applies: the load capacity of the contacts for voltage, current, and power depends essentially on the material used. To make the selection easier for you, we have compared the most important characteristics of the contact materials

Criteria for the selection of the contact material:

- Welding tendency
- Burn-off resistance
- Contact resistance
- Material migration
- Resistance to harmful gas atmospheres

Please obtain information when selecting a relay in this table:

Material	Characteristics	Recommended applications
AgNi Silver-nickel	<ul style="list-style-type: none"> • Higher welding tendency than AgSnO and AgCdO • High burn-off resistance • Lower contact resistance than AgSnO and AgCdO • Mean material migration • Low resistance to harmful gas atmospheres 	<ul style="list-style-type: none"> • Suitable for low to high resistive and low inductive loads (solenoid valves, fans, heaters) • Standard contact material for a variety of relays • Limited suitable for high inrush currents • Suitable for loads > 12 V/10 mA or 5 V/100 mA
AgNi 0,15 Au Silver-nickel flash gold plated	<ul style="list-style-type: none"> • Higher welding tendency than AgSnO and AgCdO • High burn-off resistance (gold just storage protection) • Lower contact resistance than AgSnO and AgCdO • Mean material migration • Low resistance to harmful gas atmospheres 	<ul style="list-style-type: none"> • Suitable for low to high resistive and low inductive loads (solenoid valves, fans, heaters) • The flash gold plating is a storage protection, but offers no functional improvement to AgNi • Limited suitable for high inrush currents • Suitable for loads > 12 V/10 mA or 5 V/100 mA
AgNi Au Silver-nickel hard gold plated	<ul style="list-style-type: none"> • Very low resistance to burn-off • Lowest contact resistance • High resistance to harmful gas atmospheres 	<ul style="list-style-type: none"> • Suitable for decoupling control inputs and other small resistive loads • Suitable for loads > 1 V/1 mA and < 30 V/10 mA • After switching loads > 30 V/100 mA, small powers can no longer be switched reliably because the hard gold plating has been burned-off. Only the characteristics of the base contact material AgNi still apply.
AgSnO Silver-Tin-Oxide	<ul style="list-style-type: none"> • Lower welding tendency than AgNi und AgCdO • High resistance to burn-off • Average contact resistance • Lower material migration than AgNi and AgCdO • Very low resistance to harmful gas atmospheres 	<ul style="list-style-type: none"> • Suitable for medium to high resistive DC-loads and low up to medium inductive DC loads due to low material migration. Thanks to the low tendency to weld, it is also well suited for loads with higher inrush currents such as lamp loads, light capacitive loads, fluorescent tubes, etc. • Suitable for loads > 12 V/100 mA
AgCdO Silver-Cadmium-Oxide	<ul style="list-style-type: none"> • Lower welding tendency than AgNi • High resistance to burn-off • Average contact resistance • Lower material migration than AgNi • Very low resistance to harmful gas atmospheres 	<ul style="list-style-type: none"> • Suitable for medium to high resistive and inductive AC loads, due to high burn-off resistance • Suitable for loads > 12 V/100 mA
W Tungsten	<ul style="list-style-type: none"> • Lowest welding tendency • Very high resistance to burn-off • Highest contact resistance • Low material migration 	<ul style="list-style-type: none"> • Suitable for loads with very high inrush currents of up to 165 A/20 ms or 800 A/200 µs (e.g. lamp loads, capacitive loads, fluorescent tubes, switched-mode power supplies etc.) • Often used as a pre-making contact in parallel to AgSnO contacts

Protect relay contacts effectively

Selection criteria for protective circuits of inductive loads

A

In our selection tables we specified the maximum recommended switching currents for inductive loads without protective circuits. If you want to increase the service life of the contacts, you must equip the relay contacts with an effective protective circuit.

The protective circuit on the coil side of a relay module can, for example, be implemented with an integrated or additionally pluggable freewheeling diode. However, this only protects the controlling periphery from the voltage peaks that occur in the coil of the relay module. The relay contact is usually not sufficiently protected against the voltage peaks of the inductive load to be switched, although with optimum dimensioning almost the same values for switching capacity or switching cycles can be achieved as with resistive load.

The largest reduction factor for the service life of a relay contact is the arc generated during switching off inductive loads. It is caused during the switching process by the energy stored in the coil and can destroy the contact through material evaporation and material migration.

With DC voltage and standing arc, the relay can even fail during the first switching cycle. Voltage peaks caused by electric arcs can reach values up to several 1,000 volts.

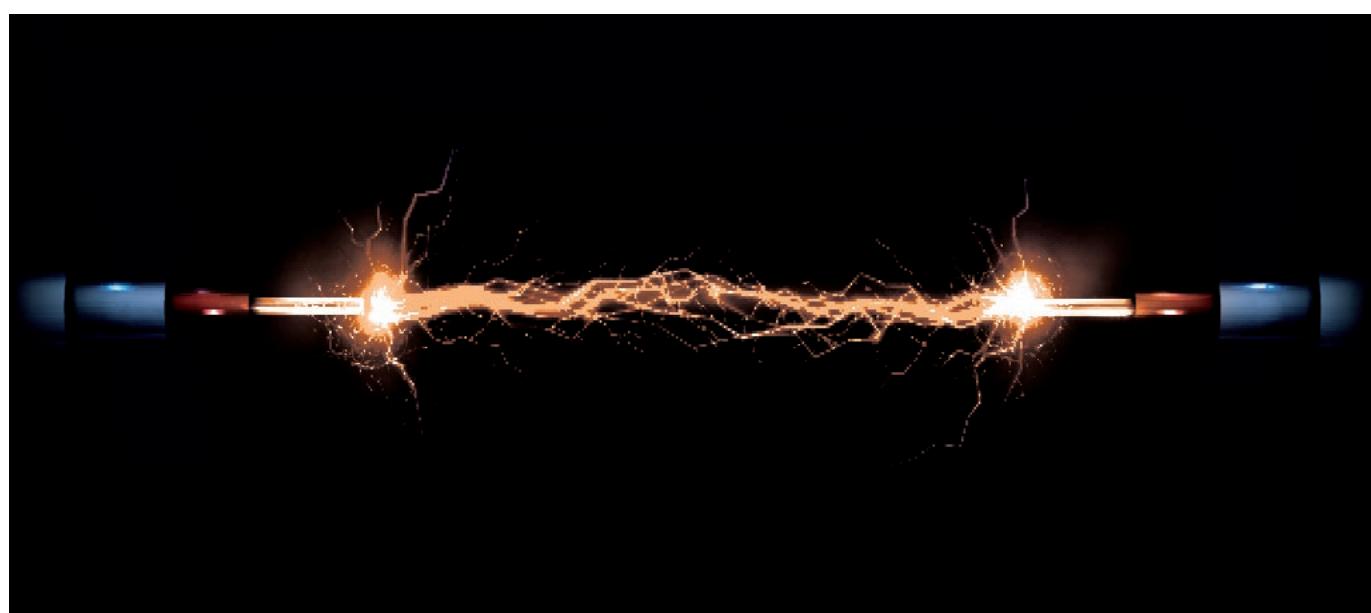

A protective circuits must be used to suppress the formation of electric arcs.

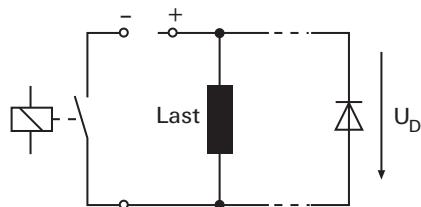

In the following, we will explain the correct installation of the protective circuit and the effectiveness of the most common types of protective circuit. There are various ways to install an effective protective circuits. For example, the protective circuit can be mounted either parallel to the relay contact or parallel to the load.

However, the protective measure should always apply directly to the source of the fault. Therefore, the protective circuit of the load is preferable to the circuit of the contact.

Advantages of a protective circuit at the load:

- When the contact is open, the load is still galvanically isolated from the operating voltage
- The switch-off peaks of the load cannot be coupled into the control lines running in parallel

Free-wheeling diodes

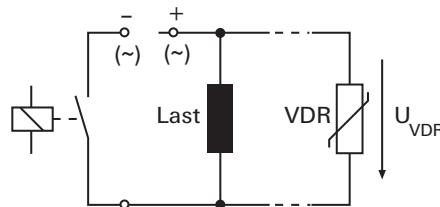

Free-wheeling diodes are used to protect against overvoltages caused by self-induction when an inductive DC voltage load is switched off (e.g. solenoid valves or electric motors). They ensure that the voltage peaks that occur are reduced to the value of the diode forward voltage (U_D). However, this leads to a delay in the voltage drop and thus in the switch-off process of the load.

Advantage:

- Uncritical dimensioning
- Very positive effect on the service life of the contacts

Disadvantage:

- Significantly extended switch off process
- Only suitable for DC voltage

Varistors

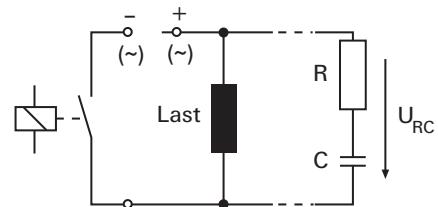

The functional principle of varistors is also based on breakdown voltages (U_{VDR}). High energies can be dissipated, but this causes the component to aging. Therefore, the breakdown voltage is reduced over time and the leakage current is increased.

Advantage:

- Uncritical dimensioning
- Suitable for DC and AC voltage
- Slightly extended switch off process

Disadvantage:

- Complex and expensive with increasing power
- Low effect on the service life of the contact

RC modules

With RC modules, voltage peaks are compensated via a capacitor. Thanks to its special characteristics during charging and discharging the interference pulses are already filtered out during the voltage rise and not only when the breakdown voltage (U_{RC}) is reached.

Advantage:

- Suitable for DC and AC voltage
- Slightly extended switch off process

Disadvantage:

- Exact dimensioning required
- High inrush current
- Low effect on the service life of the contact

 In order to implement a protective circuit tailored to the load, suitably dimensioned protective circuits are available as accessories from many manufacturers of inductive loads such as contactors or solenoid valves. This enables simple integration of the protective circuit on the load.

Switching of capacitive loads

Relays for LED lamps and devices with high inrush currents

A

Loads with capacitive load shares, especially LED lamps, place extreme demands on the switching contacts, regardless of the voltage type. They produce extremely high-energy current peaks at the moment of switching on. These can reach over 100 A and weld the contact.

Today, many loads with capacitive load shares are hidden in pre-circuits, which previously were typical inductive loads in the past, e.g. solenoid valves and contactors. Due to these pre-circuits, the operation is often possible over a wide range of input voltage.

One example are solenoid valves that can be operated with a voltage of 110 V to 230 V AC/DC. The pre-circuits can also conceal capacitors that are switched on not damped and thus generate very high inrush current peaks of up to 150 A. These current peaks also lead to welding of the contacts.

For loads with wide-range input, the inductive load share is usually unproblematic, as it is eliminated by a suitable protective circuit in the wide-range input.

The electromechanical relays listed below are ideally suited for very high inrush currents of up to 800 A for 200 μ s.

In addition to the robust AgSnO contact, some of them have a particularly welding resistant tungsten contact.

It closes ahead of the AgSnO contact and takes over the inrush current. The AgSnO contact then closes to bridge the tungsten contact. This is necessary to reduce the power dissipation, because tungsten has a much worse conductance than AgSnO.

TERMSERIES

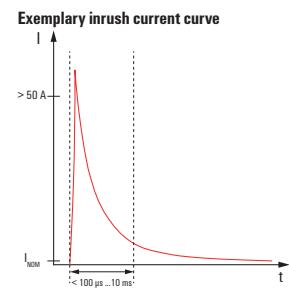

Special relay modules with tungsten contact for very high inrush currents of up to 800 A for 200 μ s

Single relay, 12.8 mm wide	Order No.

The semiconductor relays listed below are particularly suitable for short and high inrush current peaks of less than 10 ms. As they do not contain mechanical components due to their design, their outputs cannot be welded.

At the same time, they are insensitive to short-term high inrush currents, which makes them ideal for switching loads with short-term high inrush current peaks, e.g. LED lamps or devices with wide-range input.

Switching of very low power circuits

Relay for forwarding control signals

A

Low power circuits with values below 30 V/10 mA are mainly used in applications where signals have to be transmitted to control inputs, e.g. to a PLC. Such low loads do not produce a sufficient arc at the contacts.

However, this arc has two important functions:

On the one hand, it ensures continuous cleaning of the contacts; on the other hand, it can penetrate non-conductive foreign layers at the contacts. Such foreign layers are usually created by oxidation or sulfidation of common contact materials such as silver (Ag), silver-nickel (AgNi), or silver-tin oxide (AgSnO). The foreign layers can increase the contact resistance after a short time to such an extent that reliable switching of low loads is no longer possible.

For these reasons, gold (Au) is used as the contact material for relays switching small loads. It has proven itself due to its low and constant contact resistance and its resistance to ambient air containing sulphur.

Universal range

Relay modules and solid-state relays for every application

B

Machinery and plant engineering is full of challenges. One of these challenges is the selection of suitable relay products. A wide range of highly flexible modules are needed here that can satisfy a variety of different requirements.

As a full-range supplier in the field of relay modules, we provide you with a broad, varied and high-quality relay portfolio with products from the TERMSERIES, RIDERSERIES and D-SERIES. In addition, we offer KITS for signal isolation, amplification and multiplication. They are distinguished by particularly high reliability and durability and are available in various designs. In addition to our products, we offer you a wide range of comprehensive services and guidelines. This also includes our services for data support as well as for the digital availability of product data, with which we make your entire planning cycle easier.

Our relay modules are used in automation technology as well as in many other areas and industries for galvanic isolation. They are available with different types of contact such as NO contact, NC contact and CO contact and, due to their functional excellence, they provide measurable cost reductions for storage, installation and operation.

Solid-state relays

Our high-quality solid-state relays combine the highest standards with absolute quality. The extremely flexible portfolio includes a wide range of compact, durable, wear-free, silent and vibration-resistant products. For you this means: no mechanical wear, no error conditions and no noise pollution.

Electromechanical relays

Electromechanical relays are a versatile and cost-effective solution for a wide range of switching processes. They can be used for level and power adjustment and form interfaces between control, signalling or regulating equipment and the peripheral devices. However, due to the diversity of their industrial applications, the right relay must be selected for each specific application. In addition, electromechanical relays are subject to a certain amount of wear due to their design, which must also be taken into account when designing relay circuits.

Convenient for planning and documentation

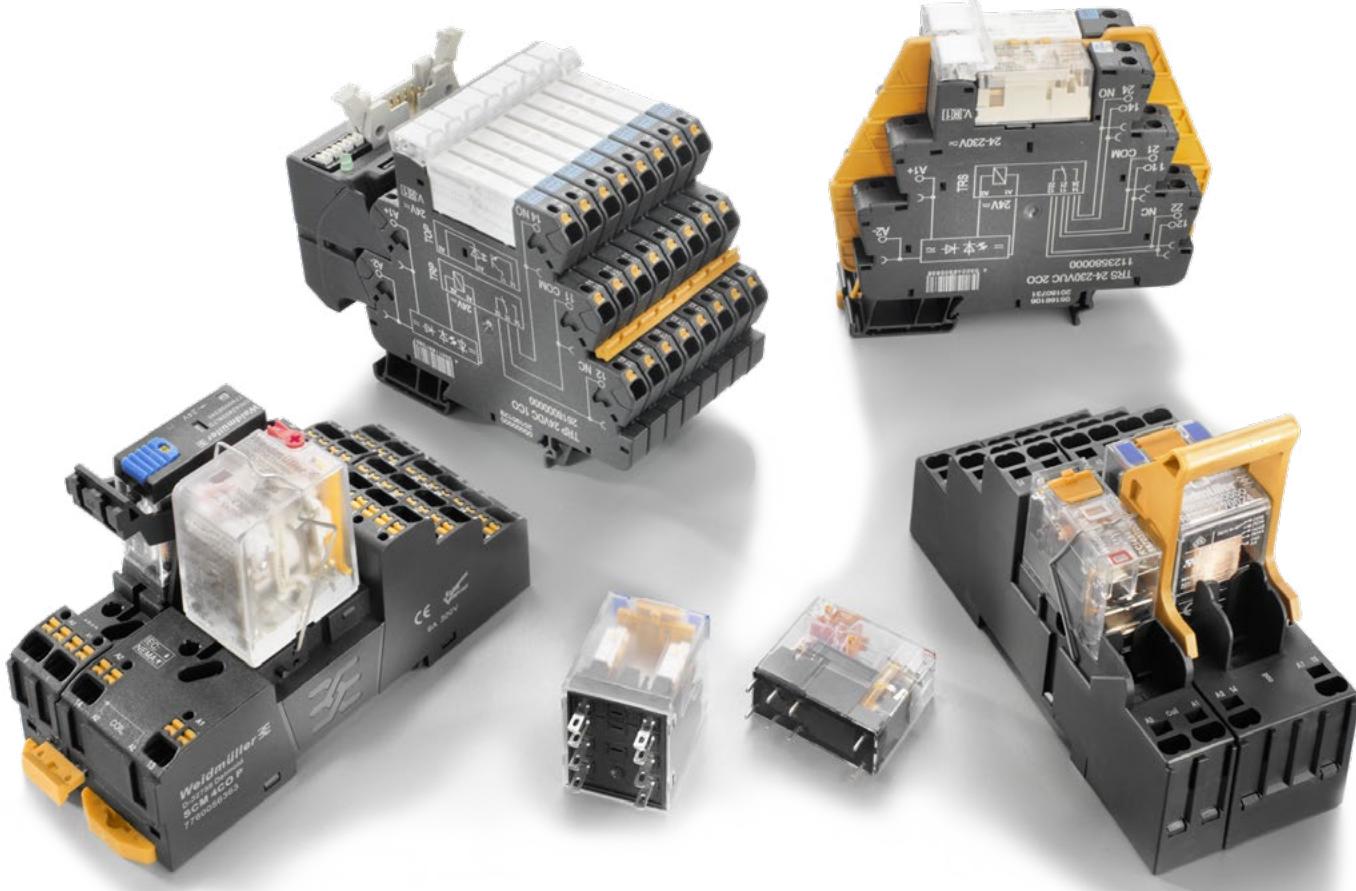

Thanks to the electronic catalogue, product data can be imported and exported to all common engineering tools such as EPLAN. It therefore also supports the use of digital twins and guarantees fast access to all item data at all times.

Compact and time-saving

The compact design of our relay modules saves a lot of space in the panel. The reduced wiring effort as well as optimal marking enable time-saving installation and maintenance.

Functional and economical

The high functional demands of our relay modules ensure measurable cost savings – through simplified storage, time-saving wiring and reliable operation, for example.

High quality and versatile

Our solid-state relays combine the latest standards with the highest quality. You benefit from a wide and flexible product range with maximum safety.

Robust and reliable

Fail-safe, wear-free, low-noise and vibration-proof components ensure interference-free work processes and safeguard the availability of the plant.

TERMSERIES

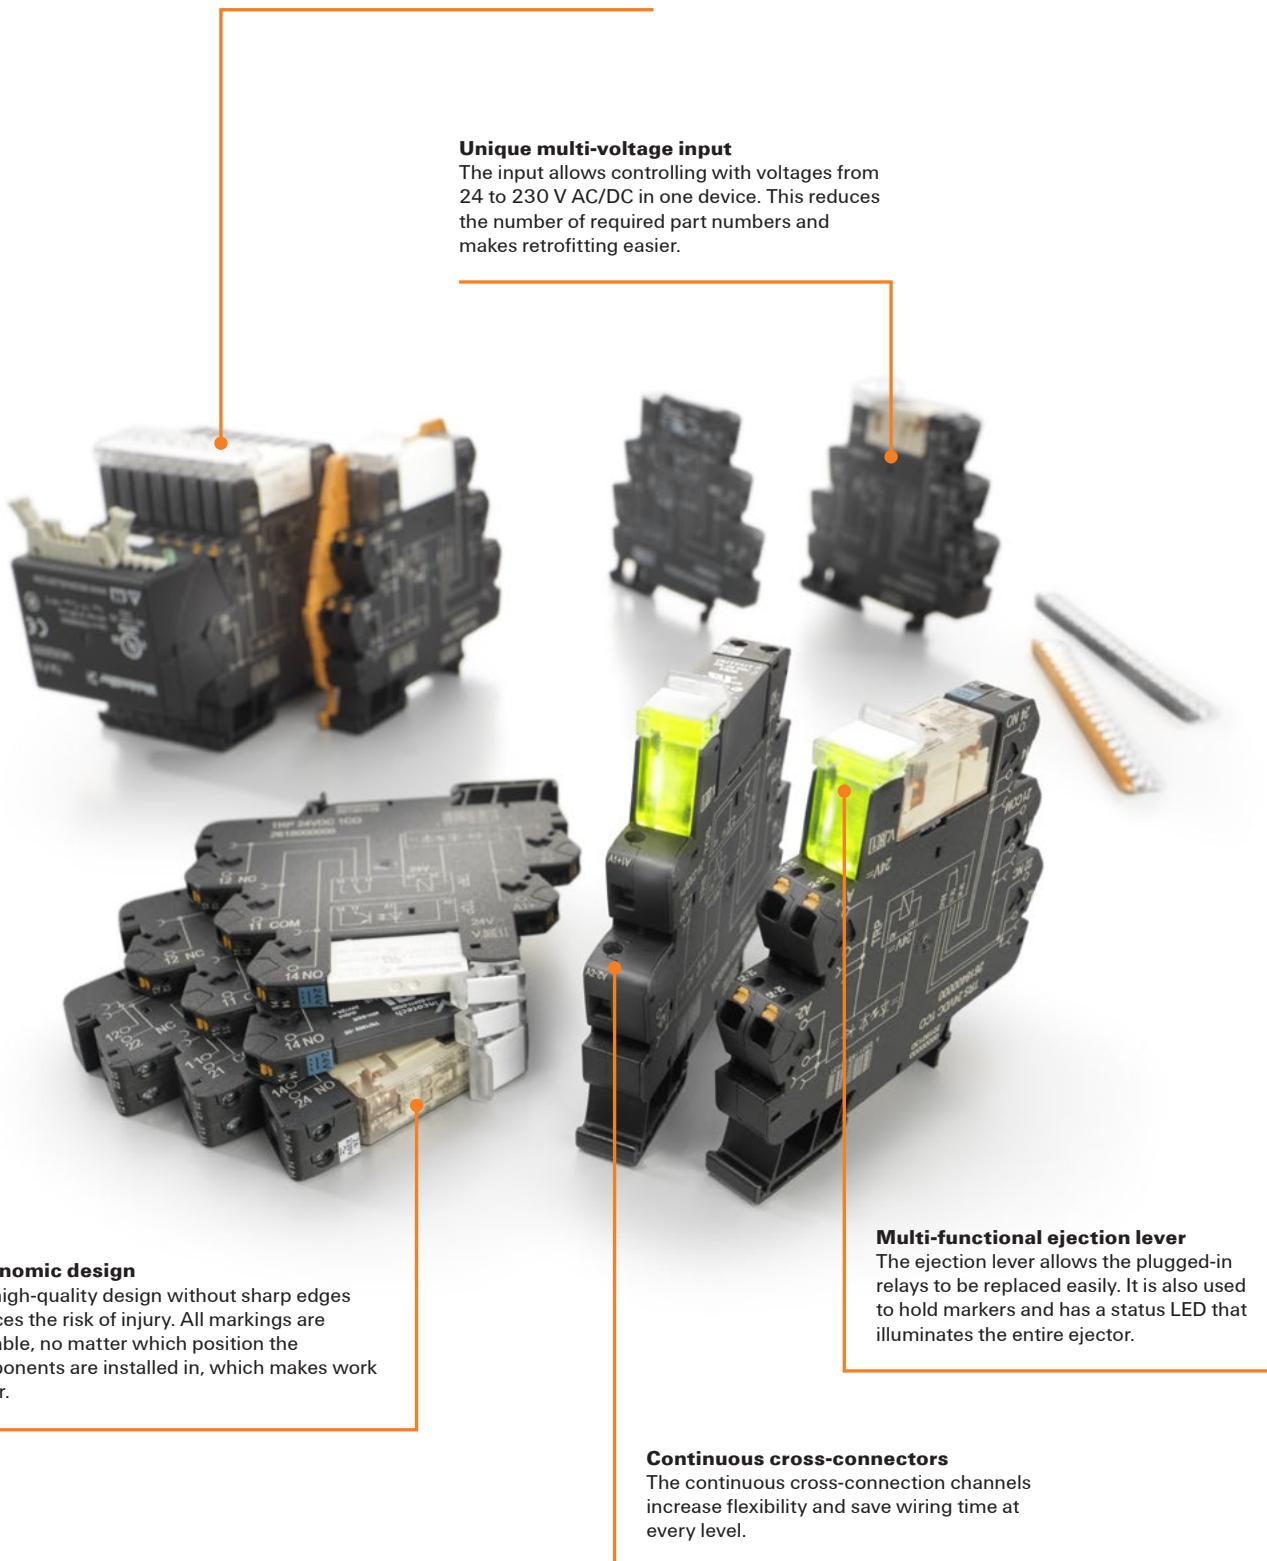

The all-rounders in a terminal block format

B

TERMSERIES relay modules and solid-state relays are real all-rounders in the extensive Klippon® Relay portfolio. The pluggable modules are available in many variants and can be exchanged quickly and easily – they are ideal for use in modular systems. Their large illuminated ejection lever also serves as a status LED with integrated holder for markers, making maintenance easier. TERMSERIES products are particularly space-saving and are available in widths from 6.4 mm. Besides their versatility, they convince through their extensive accessories and unlimited cross-connection possibilities.

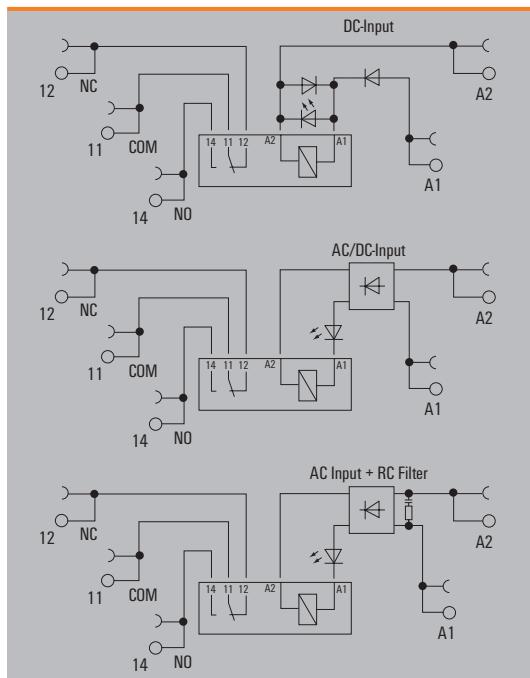

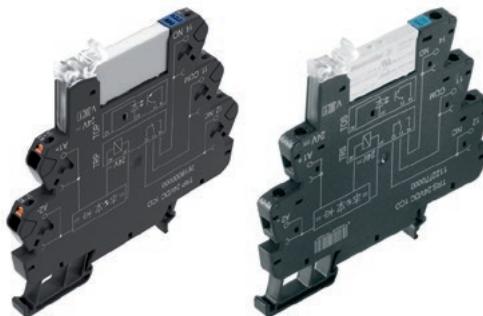

TERMSERIES products are available for special loads, for C1D2 applications, with timer functions or with positively-driven contacts. Special variants for connecting actuators – e.g. solenoid valves or contactors – are also available. The range of applications is extended by various connection systems such as PUSH IN and screw connection. And with the unique multi-voltage input, you can optimise your wiring and simplify your retrofitting processes. All products are of course approved according to the current international standards such as cULus, DNV GL and EAC.

Our TERMSERIES variants for special loads are assembled with optimised contacts. Their arrangement and material selection were adapted to suit the high loads in the industrial sector. Whether in machinery and plant engineering, robotics, wind energy or shipbuilding: With TERMSERIES products you can reliably and permanently switch industrial loads and reduce your operating costs.

Accessories

The TERMSERIES relay sockets are fitted with internal circuitry in the input which adapts the control voltage to the coil voltage of the connected relay. It should be ensured that the voltages of the socket and the pluggable relay are compatible, since the control voltage and coil voltage are not always identical (see table below). For this reason, the coil voltage is printed on the relay sockets (refer to figure).

E.g.:

A 24 V DC relay is plugged into the TERMSERIES 24 V DC socket (item no. 1123240000). The control voltage is transferred almost unchanged to the relay coil for this relay socket.

Conversely, a 60V DC relay is plugged into the TERMSERIES 230 V AC relay socket (item no. 1123320000). The internal circuitry adapts the applied coil voltage to the control voltage.

TERMSERIES interface adapter

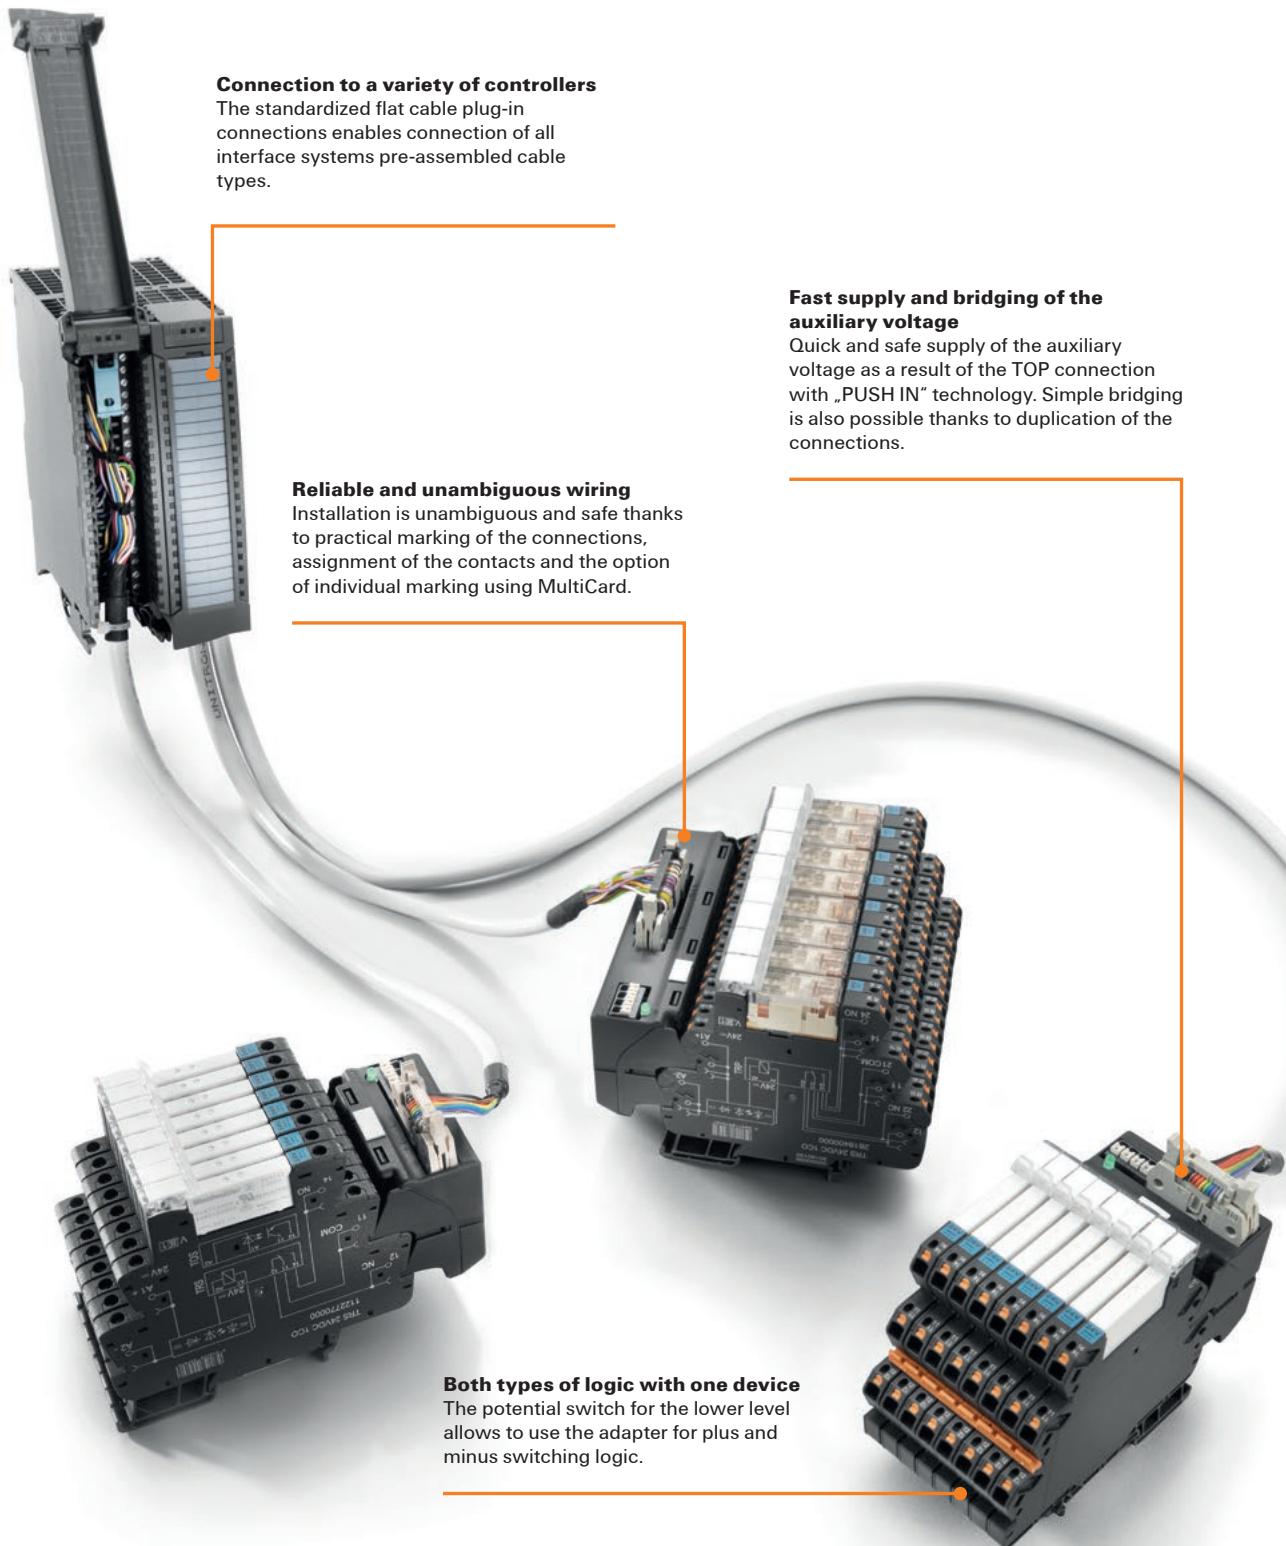

Faster signal wiring with less space

B

Our adapter for TERMSERIES Relays reduces wiring times per plug-and-play

To reduce wiring times, pre-assembled cables are used between the control system and the interface level and are simply connected to the TERMSERIES adapter. This enables throughput times in electrical cabinet building to be significantly reduced. The adapter has a universal fit and offers a genuine space advantage in interaction with the TERMSERIES products with identical contours.

TERMSERIES – Interface adapters

TERMSERIES Interface adapters

- Suitable for input and output logic
- Version for 6.4 mm TERMSERIES socket
- Supply connections (PUSH IN) in double version for supply voltage bridging
- User-friendly and clear marking
- 10-pole connecting plug according to DIN EN 60603-13

TERMSERIES accessories

Perfect additions for individual added value

B

Growing plant complexity and more individual production processes require higher flexibility and efficiency. Solid-state relays and relay modules from the TERMSERIES can be added individually according to the application. In addition to many relay modules and solid-state relay variants, we offer you suitable supply terminals, partition plates, cross-connections and markers. This provides you with a flexible modular system for signal separation and amplification, enabling you to work better, faster and more reliably.

Adjustable cross-connections

Increase the flexibility of your cross-connections. The TERMSERIES CROSS-CONNECTION (TCC) enables individually adjustable cross-connections with up to 51 poles. The maximum number of pluggable poles has been increased to 32 poles. The strip material can be shortened to the required length very easily. The cross-connectors convince thanks to their easy handling and visibility as well as their universal connection possibilities. An additional bar prevents the spring from deforming during assembly.

Versatile partition plates

Partition plates can be used to group together signals visually, to electrically isolate modules and to insert markings for a better overview. This makes them a particularly versatile accessory. Partition plates increase the clearance and creepage distances between two modules, thus increasing the rated insulation voltage between two modules to up to 600 V. Double partition plates can be marked with WAD5 or WS10/5 markers and enable continuous cross-connections. Installation is made easier with the perforations to individually break out the cross-connection channels.

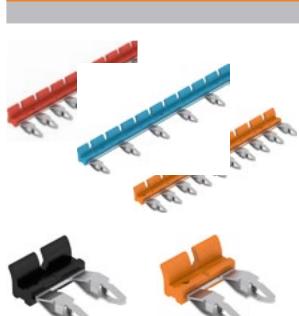

Comprehensive marking system

Marking in accordance with DIN EN 60204-1 is essential for the operation and maintenance of industrial plant. With our marking system we offer you a complete, perfectly coordinated product range of markers and printers. TERMSERIES products can be combined, for example, with the proven MultiCard format, which can be printed using various Weidmüller printers. On top of this are the innovative MultiMark terminal markers, which are particularly easy and precise to install thanks to their stretchable material. All markers guarantee excellent print results as well as long-lasting, resistant marking.

Space-saving supply modules

Our supply terminals enable potentials to be fed at the input – e.g. neutral or minus potentials – or switched potentials to be fed at the output. In conjunction with precisely fitting cross-connections from the TEMRSERIES, the connections for the cables on the relay module remain free for actuators or sensors. No additional feed-through terminal blocks are required, resulting in huge space savings in the panel. At the same time, the wiring is simplified as no double wire-end ferrules are required for the potential feed.

RIDERSERIES

Universal industrial relays with international approval

B

Relay modules from the RIDERSERIES are the right choice for the reliable separation of input and output signals in industrial automation. The high-quality and universally usable relays have been specially developed for industrial applications and offer many well-considered details. Conventional relays, for example, can be simply plugged in, with retaining clips ensuring secure mounting. The optional status LED plus test button make servicing easier. RIDERSERIES relay modules are divided into two product families. Both can be used in a wide range of industrial applications and have all the standard international approvals such as cURus, CSA, DNV GL and EAC.

Wide performance range

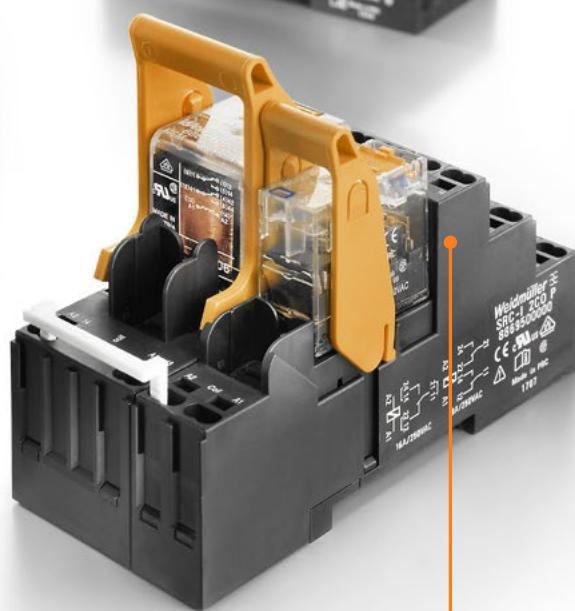

Suitable for control voltages from 12 V to 230 V, as well as for switching currents from 6 A to 16 A, and therefore suitable for a wide range of applications.

**Wide range of variants**

Available in versions with 1 to 4 CO contacts and with a PUSH IN connection system or screw connection. In addition, there are versions with built-in LED or test button as well as precisely fitting accessories from cross-connections to markers.

Optional relay KITs

Relay KITs consisting of relays with status indicator and sockets with retaining clip provide greater convenience. The KITs are delivered completely assembled as well as function and insulation-tested. This saves time and reduces the number of material numbers.

**High quality**

Tailored to industrial applications – the stable relay pins are compatible with industrial standard pinning.

RCI-KITP with PUSH IN connection

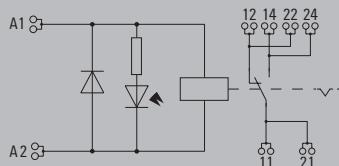

1 CO contact AC/DC coil

- Mounted kit consisting relay, socket and retaining clip
- 100 % function tested
- 100 % check of the dielectric strength between input - output
- Optional test button with mechanical status indicator
- Bright status LED (AC coil: red / DC coil: green)
- Identification of coils (AC red / DC blue)

Article numbers for LED modules with red LED are to be found at catalog [redacted]

Installation of the cross-connection on the relay socket

Plug the cross connection into wire-connection opening
and fix it with tighten the screw

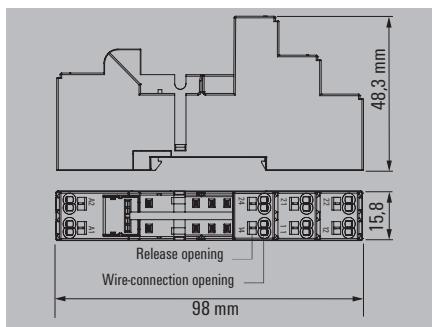

Cross connection:
SCR-I OV S
Part-No. 1132070000

Sockets:
for example SRC-I 2CO
Part-No. 8869490000

Accessories for RCI relays**1 CO contact and 2 CO contacts**

PUSH IN connection operation

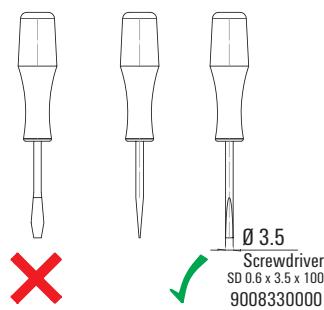

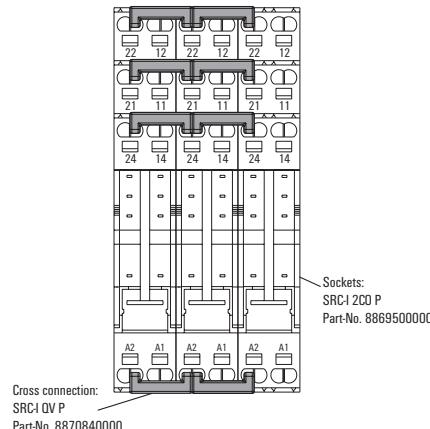

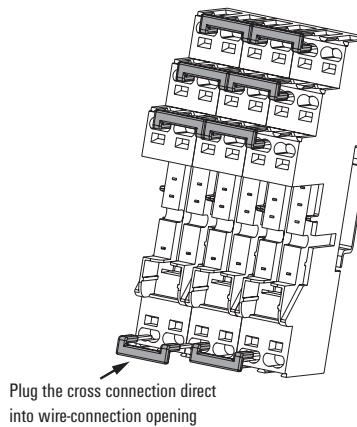

Insert connector

Remove connector

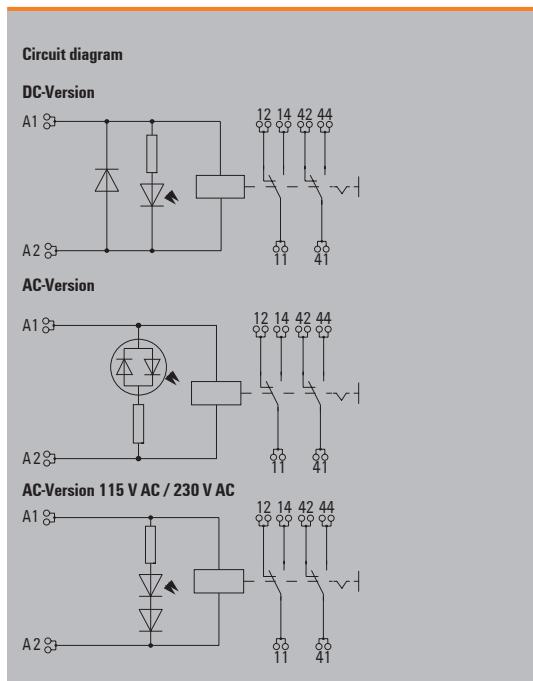

Recommended screwdriver

**Installation of the cross-connection on the relay socket**

If more than 2 poles are connected with stacked cross-connection ridges, then the bottom ridges must be stripped to the appropriate length and shortened for correct fitting.

RCM KIT with PUSH IN connection**2 CO contacts AC/DC coil**

- Mounted kit consisting relay, socket and retaining clip
- 100 % function tested
- 100 % check of the dielectric strength between input - output
- Optional test button with mechanical status indicator
- Bright status LED (AC coil: red / DC coil: green)
- Identification of coils (AC red / DC blue)

PUSH IN connection operation

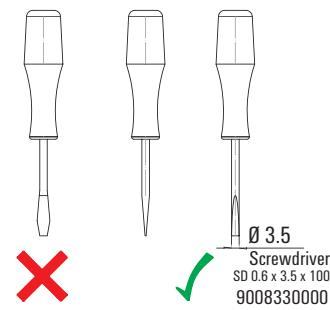

Insert connector

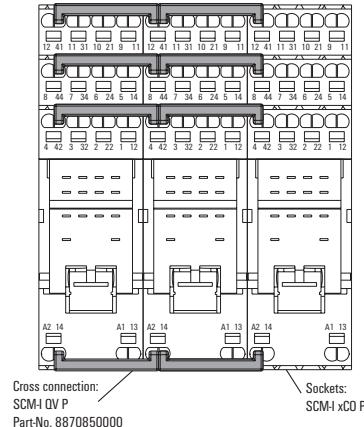

Remove connector

Recommended screwdriver

**Installation of the cross-connection**

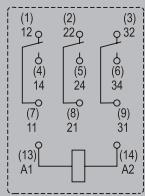

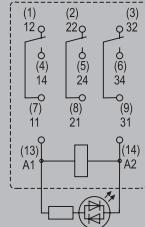

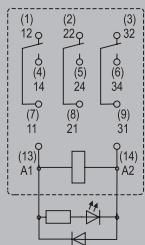

Plug cross connection direct into wire-connection opening

If more than 2 poles are connected with stacked cross-connection ridges, then the bottom ridges must be stripped to the appropriate length and shortened for correct fitting.

RCM relay**3 CO contacts, AC/DC coil**

- Solid plug-in connections
- Latching / spring return operable test button and mechanical status indicator (for version with test button)
- Optional: Bright status LED (AC coil: red / DC coil: green)
- Optional: free-wheeling diode
- Identification of coils (AC red / DC blue)

**B****Circuit diagram**

PUSH IN connection operation

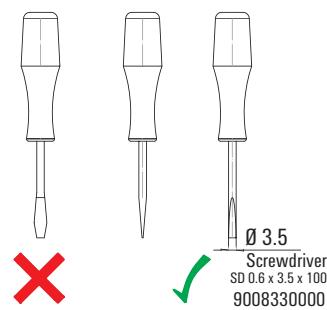

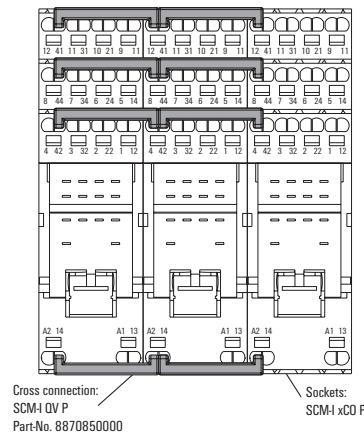

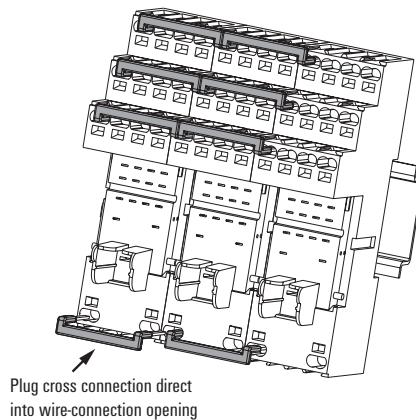

Insert connector

Remove connector

Recommended screwdriver

**Installation of the cross-connection**

If more than 2 poles are connected with stacked cross-connection ridges, then the bottom ridges must be stripped to the appropriate length and shortened for correct fitting.

D-SERIES

Universal industrial relays with high efficiency

B

D-SERIES relays have been developed for universal use in industrial automation applications where high efficiency is required. They have many innovative functions and are available in a particularly large number of variants and in a wide range of designs for the most diverse applications. Thanks to various contact materials (AgNi and AgSnO etc.), D-SERIES products are suitable for low, medium and high loads. Variants with coil voltages from 5 V DC to 380 V AC enable use with every conceivable control voltage.

With relays from the D-SERIES, you can separate input and output signals reliably and benefit from many well-considered details. For example, conventional relays can simply be plugged in and fixed with a retaining clip. The clever contact series connection and a built-in blowout magnet reduce contact erosion for loads up to 220 V DC/10 A, thus extending the service life. The optional status LED plus test button ensures convenient service operations. D-SERIES relays are available in DRI and DRM versions with either sockets for PUSH IN technology or screw connection and can be supplemented with a wide range of accessories. These include markers and pluggable protective circuits with LEDs or free-wheeling diodes.

Wide range of variants

Thanks to the different series and designs, D-SERIES products are suitable for a wide range of industrial applications. With the DRI, DRM and DRR series in the universal range as well as the DRL, DRW and DRH series in the application range, a suitable solution is available for almost all applications.

Solutions for special applications

Relay modules for switching high DC loads up to 220 V DC complete the range and make the D-SERIES an all-rounder.

**Long-lasting quality**

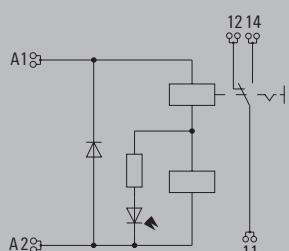

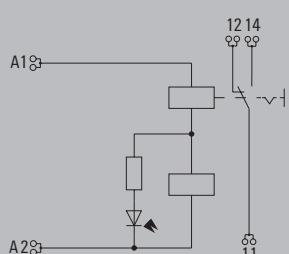

D-SERIES relays are extremely robust. They can be ordered with a wide range of suitable contact types for various industrial applications, which significantly extends the service life.

Convenient relay KITS

Our fully assembled and functionally tested relay KITS save time during installation and simplify logistics. They can each be ordered under a single item number and they reduce the number of storage locations.

DRI KIT with PUSH IN connection**1 CO contact, AC/DC coil**

- Mounted kit consisting relay, socket and retaining clip
- 100 % function tested
- 100 % check of the dielectric strength between input - output
- Optional: test button with coloured control voltage marking (AC coil: red / DC coil: blue)
- Bright status LED (AC coil: red / DC coil: green)

MCZ-SERIES

High reliability in a terminal block format

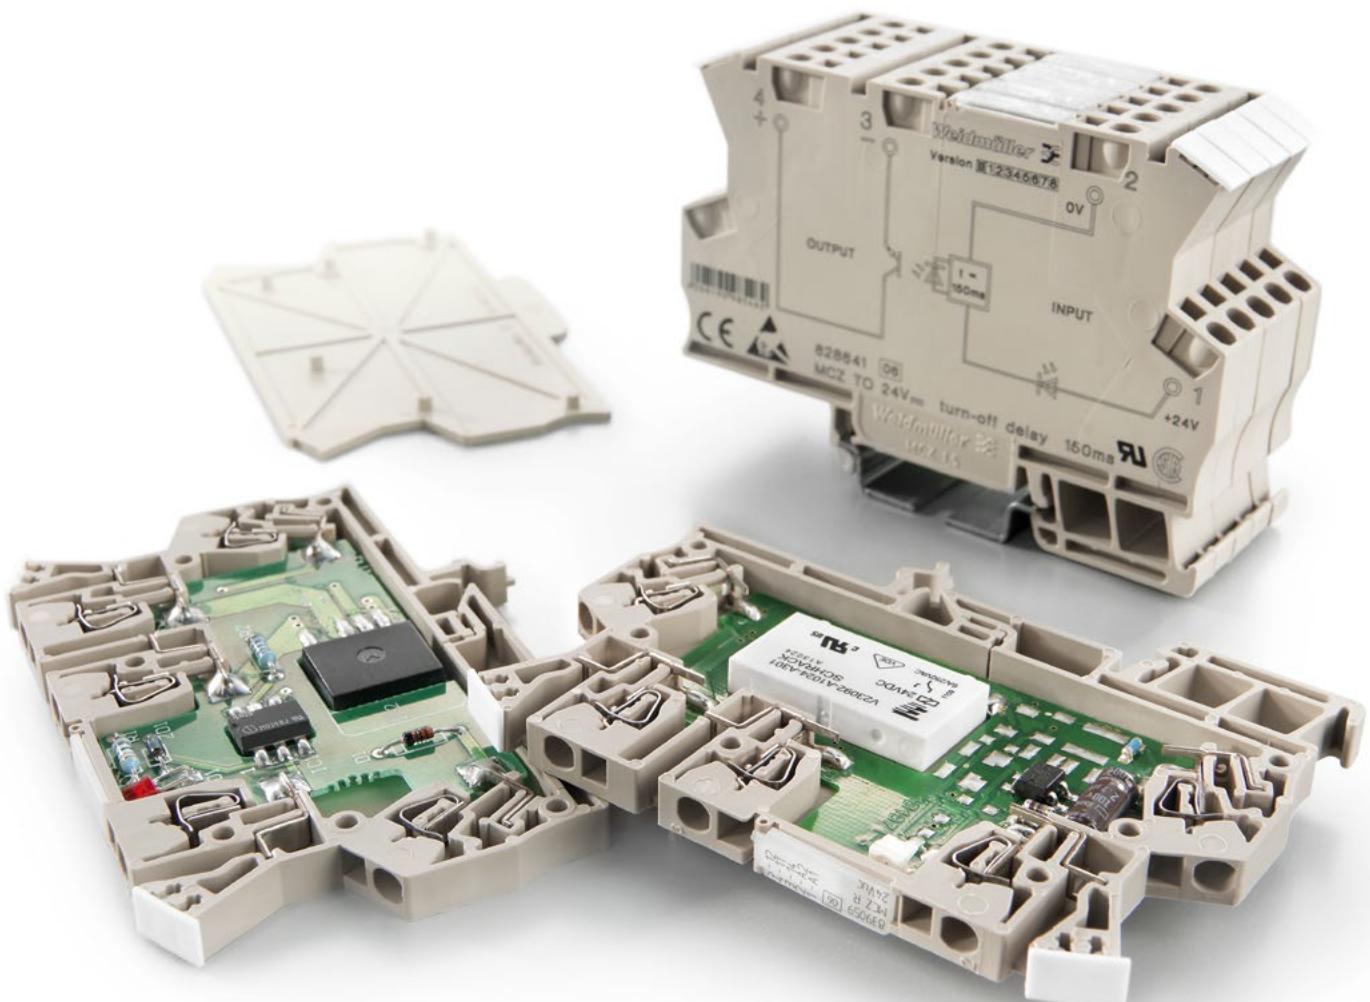

B

MCZ SERIES relay modules are among the smallest on the market. Thanks to the small width of just 6.1 mm, a lot of space can be saved in the panel. All products in the series have three cross-connection terminals and are distinguished by simple wiring with plug-in cross-connections. The tension clamp connection system, proven a million times over, and the integrated reverse polarity protection ensure a high level of safety during installation and operation. Precisely fitting accessories from cross-connectors to markers and end plates make the MCZ SERIES versatile and convenient to use.

MCZ TRAK – tested according to DIN EN 50155

- Variants of the MCZ TRAK type are particularly suitable for the transport sector
- Tested according to DIN EN 50155, they meet the special requirements for operating voltage, temperature range, shock and vibration resistance as required for use in the railway industry.

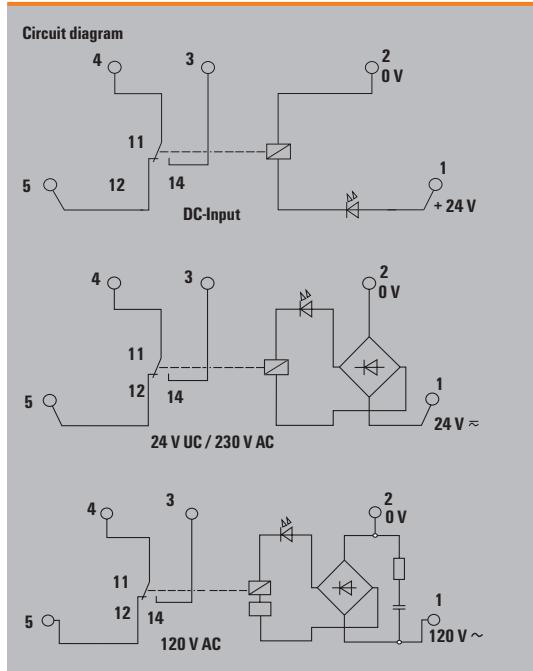

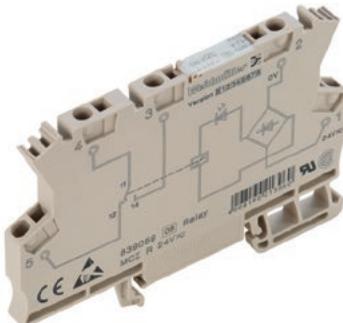

MCZ R**1 CO contact AC/DC/UC coil**

The module can be used as a universal interface between the controller and the actuator to switch small and medium-sized loads

- Reduced installation and commissioning costs, thanks to the use of the proven tension-spring connection system
- Pluggable cross-connection at input and output minimises the wiring workload.
- Width 6 mm
- For mounting on TS 35

Application range

Relay modules and solid-state relays for specific applications

In many industrial applications today, individual, customised solutions and components are used to increase system efficiency and system productivity. These include, for example, protective circuits for greater fail-safe performance, timing relays for adjusting signals, relays for functional safety and space-saving components for use in limited installation spaces.

With our application range we provide you with a customised portfolio to increase your productivity, efficiency and safety in the most diverse fields of application. What's more, we work with you to develop customised solutions, combining the advantages and features of our portfolio with our expertise and consulting services.

We have a wide range of products that combine application-specific designs, the latest technologies and well-proven components to meet all your requirements.

Special loads

Relays to switch and monitor special loads, such as inductors and high inrush currents, safely and reliably.

Sensor isolation

Space-saving and fast switching coupling elements to decouple sensors from the field.

High switching frequencies

Specially designed solid-state relays for reliable and fast decoupling of signals up to 550 kHz.

Signal adaption

Adaptation of signals and their transmission from other systems to the control cabinet level.

Timing functions

Timing relays are used in automation technology to compensate for errors due to short cycle times.

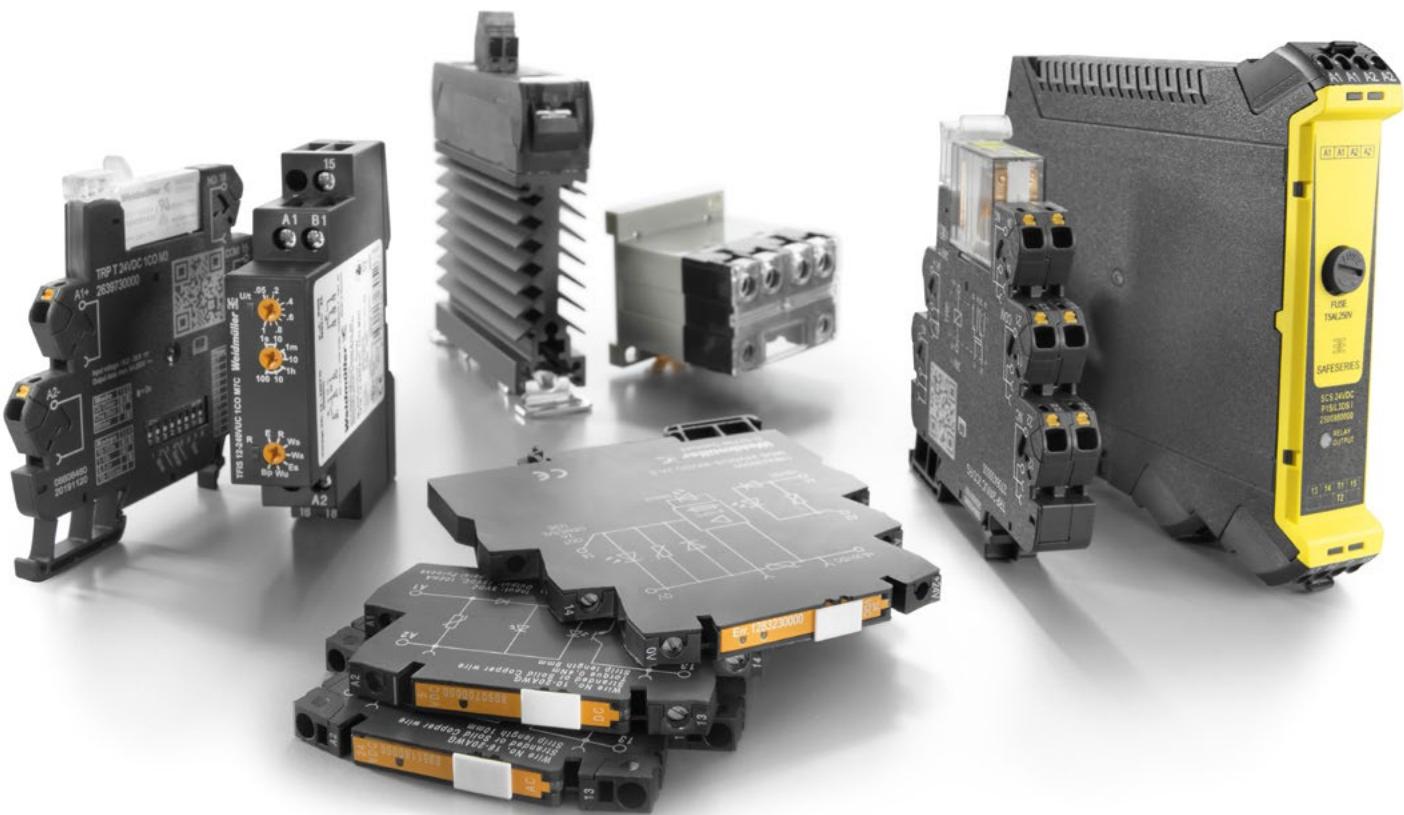

Functional safety

Specific safety relays required for signals in process safety-related systems.

Power

Power solid-state contactor up to 75 A and miniature contactors up to 30 A.

TERMOPTO

Wear-free potential isolation in terminal block design

C

In many applications, it is essential that relays for potential isolation and signal adjustment perform their tasks reliably and permanently. Instead of wear-prone electromechanical solutions, maintenance-free relays with integrated potential isolation are increasingly being used.

TERMOPTO solid-state relays in terminal block design are the perfect solution for the simple and reliable decoupling of digital signals. Besides their particularly compact design, they are distinguished by their PUSH IN connection system, plug-in cross-connections and an optimal price/performance ratio.

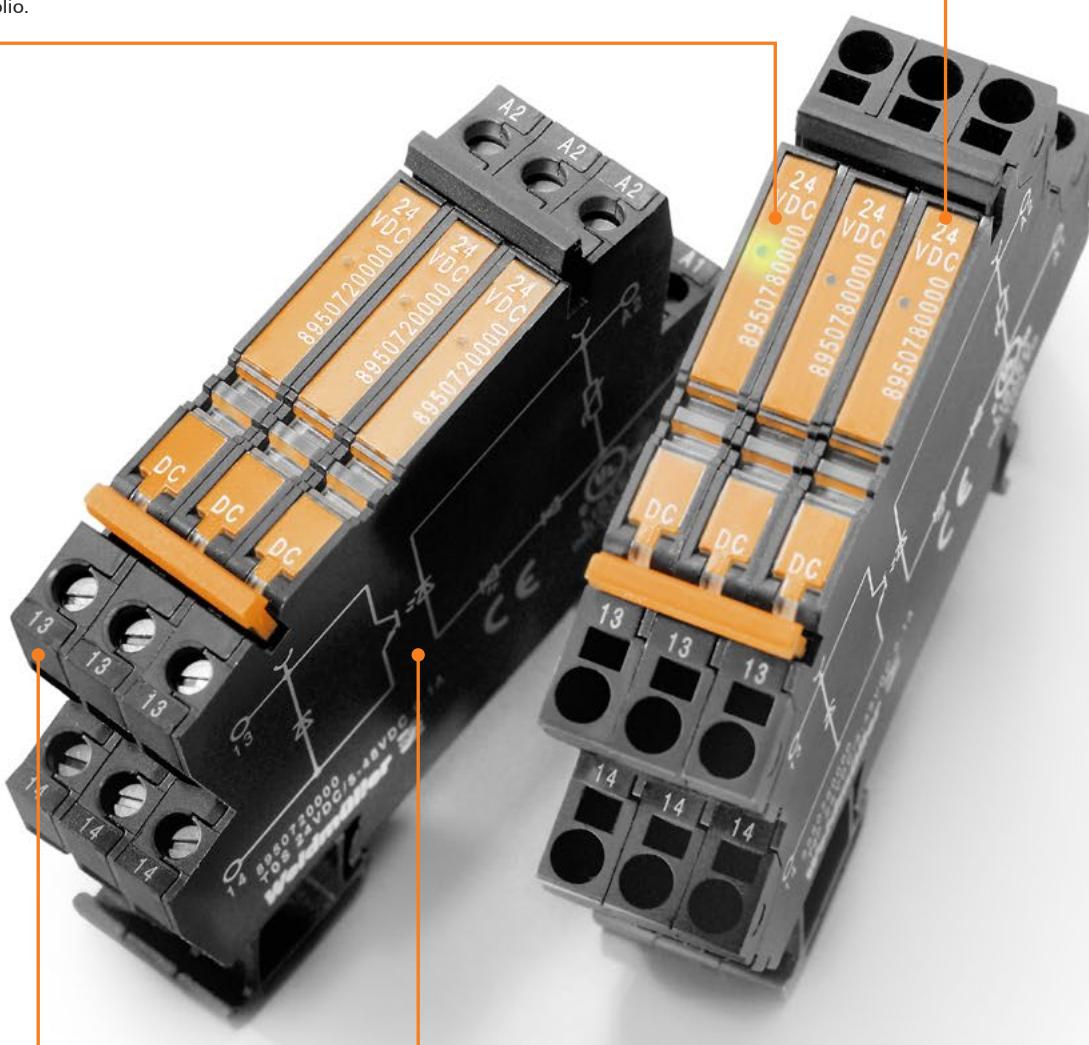

With TERMOPTO solid-state relays, you save space in the panel, reduce your service costs and sustainably increase plant availability. You also reduce the complexity of the required accessories as you can use components from the Weidmüller portfolio, from cross-connectors to markers.

Well-designed all round

The LED status indicator provides information about the switching status. Suitable accessories from cross-connectors to continuous marking solutions can be procured from the Weidmüller portfolio.

Wide voltage range

Ten input voltages from 5 V DC to 230 V AC, a particularly compact multi-voltage input for 48 to 60 V DC and a variant for input voltages from 48 to 60 V AC ensure a high level of flexibility.

**Permanently reliable**

The wear-free solid-state technology with comprehensive protective suppressor circuit for inputs and outputs makes TERM OPTO particularly long-lasting and reliable.

Extremely compact

The compact design with a width of just 6.1 mm reduces the space required in the panel by more than 80% compared to conventional solid-state relays.

MICROOPTO

Compact and powerful solid-state relays in terminal block design

C

Saving space in the panel is becoming more and more important, and requires increasingly compact components. With the compact and powerful MICROOPTO solid-state relays, you benefit from our decades of experience in manufacturing products in terminal block design.

The MICROOPTO family comprises high-quality solid-state relays for application-specific problem solving and delivers high performance in a width of just 6.1 mm. The wide range of accessories from plug-in cross-connections to end-to-end marking solutions makes it particularly versatile. Thanks to international approvals, they can be used worldwide. Reliable function is ensured by the integrated protective suppressor circuit for inputs and outputs.

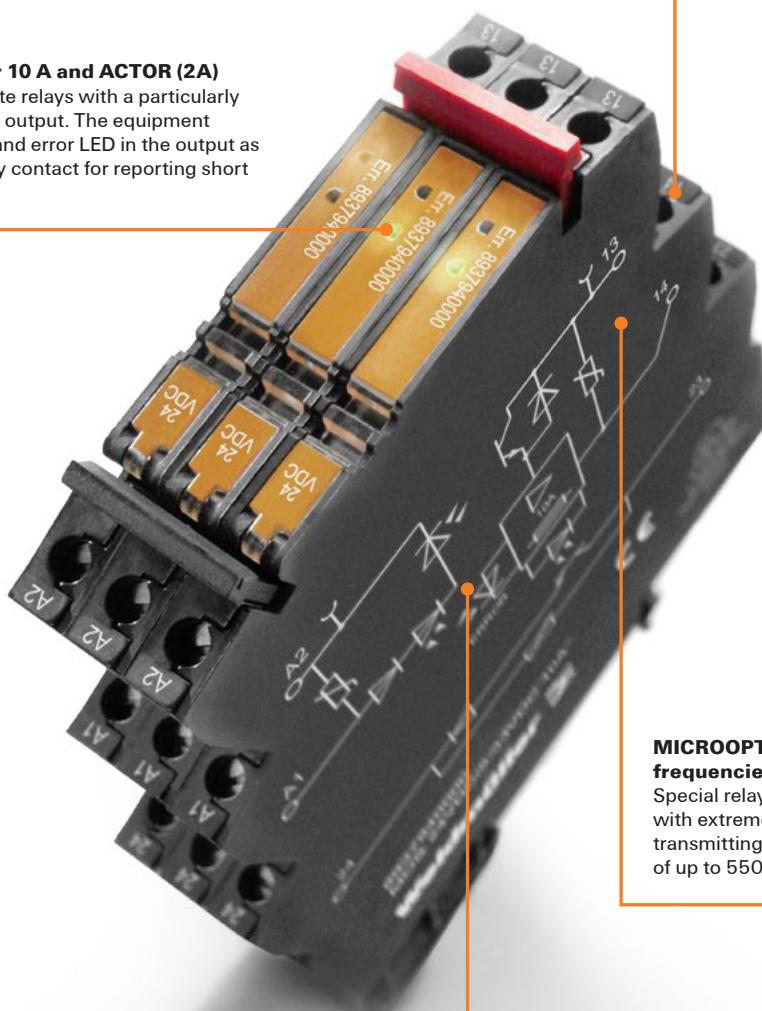

The wide MICROOPTO portfolio includes a range of solutions for special loads. For example, for inductive loads up to 10 A at 24 V DC or for DC loads up to 300 V. In addition, there are solutions for decoupling 5 V TTL inputs and outputs, for frequencies up to 550 kHz, as well as the 1 CO contact version for inverting signals.

MICROOPTO for signal adjustment

Available in special versions for the transmission of 5 V TTL signals to PLC systems and industrial computers – or equipped with 1 CO contact output for inverting signals.

MICROOPTO for 10 A and ACTOR (2A)

Powerful solid-state relays with a particularly short-circuit-proof output. The equipment includes a status and error LED in the output as well as an auxiliary contact for reporting short circuits.

**MICROOPTO for high switching frequencies**

Special relays for reliable signal decoupling with extremely fast switching operations or for transmitting signals with switching frequencies of up to 550 kHz.

MICROOPTO for 300 V DC

Special solid-state relays for DC voltages up to 300 VDC, 1 A. The integrated protective suppressor circuit also enables the switching of inductive loads with high DC voltages.

Special loads

Reliably switch or monitor inductive, capacitive and high loads

C

If special loads such as inductivities or high inrush currents are to be switched or monitored safely and reliably, you need individually tailored relay modules and solid-state relays. These customised solutions extend the service life of the switching element and, what's more, they can be installed in the panel in a space-saving manner thanks to optimised connection options.

Capacitive loads

Many loads with capacitive load components are now concealed in upstream pre-circuits, e.g. in solenoid valves, contactors or power supplies for LED lighting. These pre-circuits can contain capacitors that generate high inrush current peaks of up to 150 A. Such current peaks can lead to welding of the output contacts or destroy the output. To avoid this, special relay modules and solid-state relays from our portfolio are used.

Inductive loads

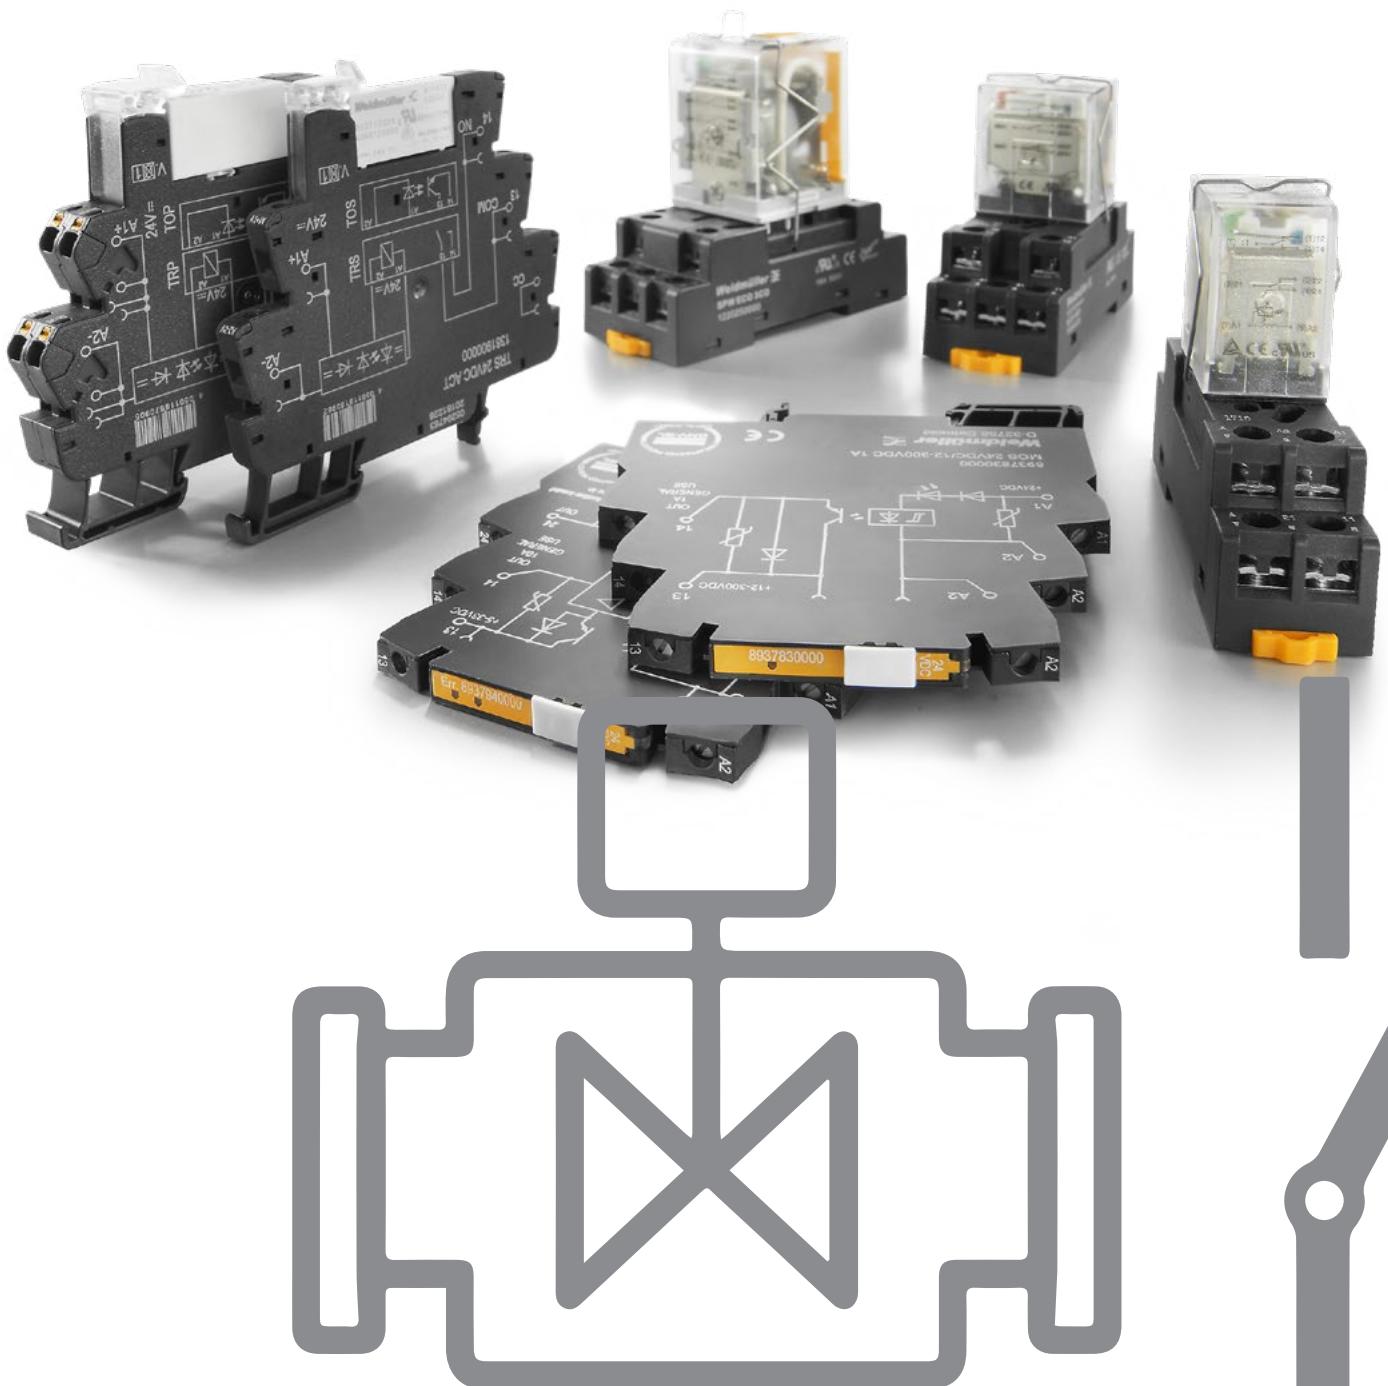

Switching inductive loads, e.g. solenoid valves, can cause electric arcs with voltage peaks of up to several thousand volts. They are caused during the switching process by the energy stored in the coil and can destroy the contact through material evaporation and material migration. With high DC voltage and a continuous light arc, the relay can even fail during the first switching cycle. In order to suppress the formation of electric arcs, you need to use an external protective suppressor circuit. We offer special products for switching inductive loads, which have a special overload or protective suppressor circuit for the output, for example.

High DC voltages

Standard relay modules can only switch relatively low DC currents because they lack the zero crossing to extinguish the light arc. Their maximum DC current value also depends on the switching voltage as well as the design conditions such as contact gap and contact opening speed. Our power relays for switching high DC loads have a built-in blowout magnet and a large contact gap to significantly minimise contact wear.

Wiring-optimised variants

The optimisation of wiring time and space requirements is becoming increasingly important. Our versions with snap-on PE foot allow for fast wiring of actuators where a PE contact is required. This means that no additional PE terminal is required in the panel. Our 1 NO contact variants allow the use of a connection on the relay socket for wiring the negative or neutral conductor potential. Therefore, the negative potential is bridged to the designated connection with the aid of a power-feed terminal in order to wire the actuators directly – without an additional terminal for the negative potential.

For switching valves up to 24 VDC 10 A

- Width only 6 mm
- Plug-in cross-connector
- For mounting on TS 35
- Status display and error signaling contact with an error in the output

The **MICROOPTO SOLENOID** solid-state relay is used specifically as a switching amplifier for actuators up to 24 V DC and 10 A with inductive loads such as solenoid valves and contactors.

A potential-free signalling contact transmits errors, such as short circuits, to the controller.

The **MICROOPTO SOLENOID** solid-state relay is short-circuit-proof and protected against power-related transients and voltage peaks by extensive protective circuits. The closed housing also offers a high level of protection against contact.

Note**Accessories****Note**

Accessories and dimensioned drawings: refer to the MICROOPTO Accessories page.

The solid-state relay **MICROOPTO 300 V DC** has been developed as a switching amplifier for high inductive loads up to 300 V DC and 1 A in motor brakes and contactors.

A power boost in the load circuit compensates transient overloads (20 A for 20 ms / 5 A for 1 s) such as making or breaking spikes. Additional protective circuits counter higher overloads.

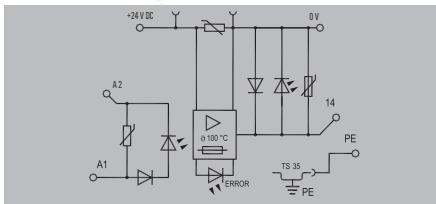

Derating curve**z. B. Example: motor brake**

For direct connection of actuators up to 24 V DC 2 A

- Only 6 mm modular width
- Plug-in cross-connection
- PE connection direct to mounting rail
- Status display when error in output

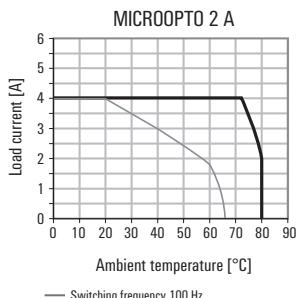

8...30 V DC 2 A

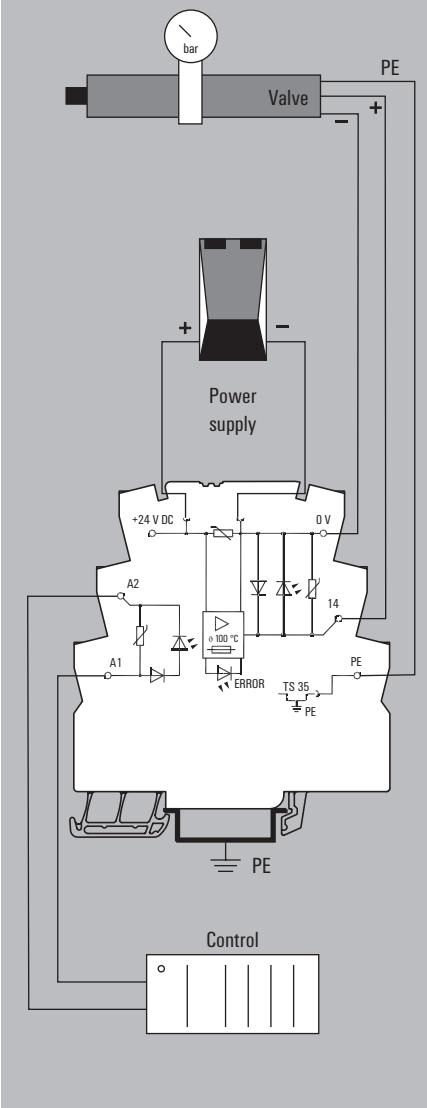

The solid-state relay **MICROOPTO ACTOR** has been specifically designed as a switching amplifier for actuators up to 24 V DC and 2 A with inductive loads such as solenoid valves and contactors. 3-wire actuators can be connected directly to the module.

This is short-circuit proof and protected against application-related transients and spikes by extensive protective circuitry.

Example: pneumatic valve

Note

Accessories and dimensional drawings: refer to the MICROOPTO Accessories page

The solid-state relay **MICROOPTO ACTOR** has been specifically designed as a switching amplifier for actuators up to 24 V DC and 2 A with inductive loads such as solenoid valves and contactors. 2-wire actuators can be connected directly to the module. This is short-circuit proof and protected against application-related transients and spikes by extensive protective circuitry.

Example: pneumatic valve

Solid-state relay, 3...33 V DC / 4 A**Output versions**

- Space-saving 6.1 mm width
- Plug-in cross-connections
- Screw and PUSH IN wire connection
- Enclosed design

24 V DC

Special loads - D-SERIES

DRW power relay

2 CO contact, AC/DC coil

3 CO contact, AC/DC coil

- Suitable for switching high load voltages
- With LED and test button

Technical data

Load side

Rated switching voltage / Continuous current	400 VAC / 16 A
Max. switching voltage, AC	400 V
Inrush current	80 A / 50 ms
Min. switching power	100 mA @ 12 V
Contact type	2 CO contact with test button (AgCdO)
Mechanical service life	10 x 10 ⁶ switching cycles
Max. switching frequency at rated load	0.1 Hz

General data

Ambient temperature (operational)	-40 °C...60 °C
Storage temperature	-40 °C...60 °C
Humidity	35 % to 85 % relative humidity level
Approvals	CE; cURus; EAC

Insulation coordinates

Rated voltage	400 V
Impulse withstand voltage	
Dielectric strength, Input/Output	2.5 kV _{eff} / 1 Min.
Dielectric strength of neighbouring contacts	1.5 kV _{eff} / 1 min.
Dielectric strength to mounting rail	
Creepage and clearance distance input - output	≥ 6.3 mm
Overvoltage category	III
Pollution degree	3

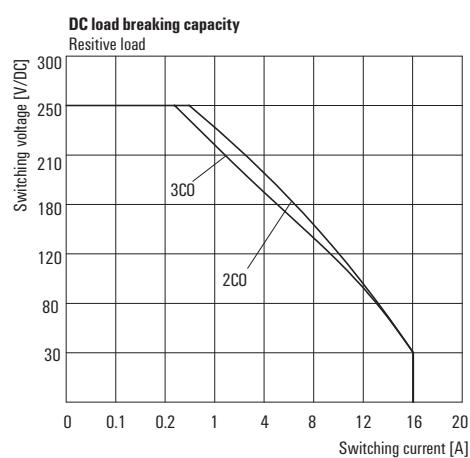

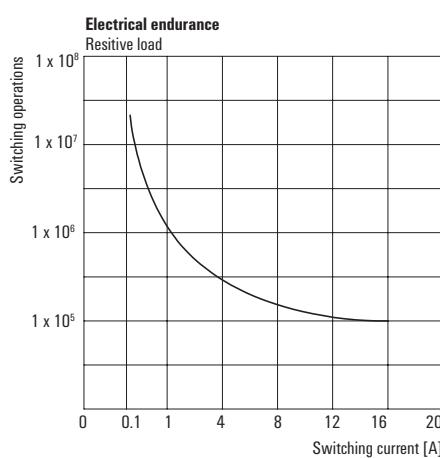

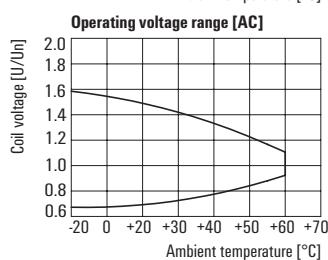

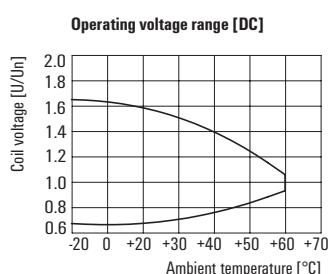

Dimensions

Flat blade connections (4.8 mm x 0.5 mm)
Depth x width x height mm 48 / 36 / 36

Sensor isolation

Compact and powerful solid-state relays for isolation sensor signals

C

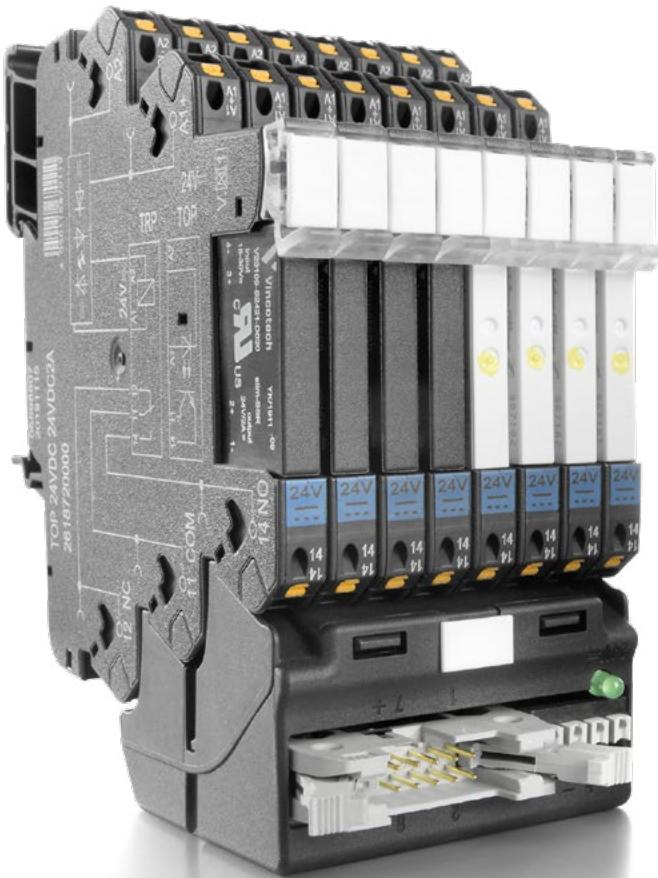

In order to reliably decouple sensor signals from the field, space-saving and fast-switching coupling elements are required. We offer special solid-state relays for sensor isolation, as well as relay modules with gold-plated contacts for reliable switching of small currents and voltages, as they typically occur when switching sensor signals.

Solid-state relay for sensor isolation

As there is often a high number of switching cycles in sensor isolation, it makes sense to use solid-state relays. They have no mechanical wear and therefore work reliably in the long term. Our solid-state relays are extremely compact and, thanks to suitable accessories, enable quick installation. By using TERMSERIES interface adapters in conjunction with pre-assembled cables, the wiring time can be reduced further.

Electromechanical relays with gold contacts

In applications where sensor isolation is only carried out at longer intervals and with low power (< 30 V/10 mA), oxide layers can form on the contacts. This usually occurs in applications where signals are forwarded to control inputs or PLC systems. Due to the low loads, there is not enough light arcing at the contacts to remove the oxide layer during switching. Therefore, relay modules with oxidation-resistant gold contacts are used.

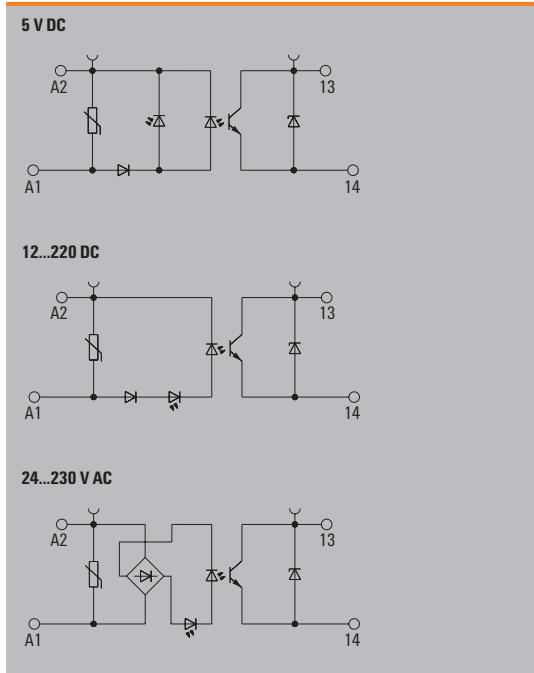

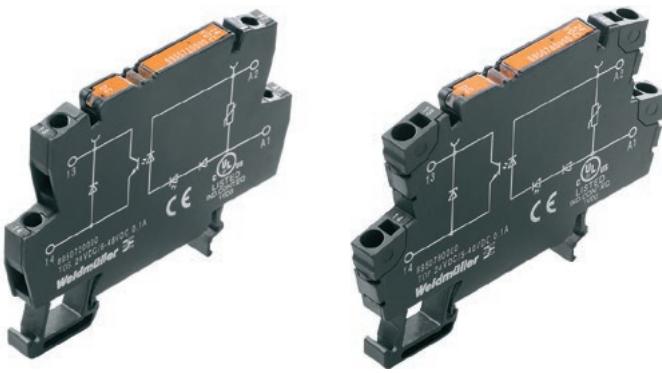

Sensor isolation – TERMOPTO

Solid-state relays 5...48 V DC / 100 mA

Output versions

- Space-saving 6.1 mm width
- Plug-in cross-connections
- Screw and PUSH IN wire connection
- Enclosed design

Technical data

Applications

The **TERMOPTO** opto module is used in industrial applications in which electrical isolation and signal conditioning without switching amplification is sufficient.

The compact design in terminal-block format saves space on the rail and offers the option of a pluggable cross connection.

The choice between 10 input voltages and 3 output voltages, as well as screw or PUSH IN connection technology, gives 60 variations for different applications.

The integrated protective circuit ensures sufficient protection in applications with resistive, as well as slightly inductive and capacitive loads. For purely inductive, capacitive or comparable loads with high switch-on and switch-off peaks, such as solenoid valves or filament lamps, ensure that the module is dimensioned appropriately or an additional safeguard is used.

Note

High switching frequencies

Special solid-state relays for reliable and fast decoupling of signals up to 550 kHz

C

Due to their design, solid-state relays can already switch significantly faster than electromechanical relays. However, there are applications in which signals have to be switched even faster or at an even higher frequency. For particularly fast switching processes, or the transmission of signals with high switching frequencies between 1 and 550 kHz, we have developed special solid-state relays that are precisely tailored to these specific applications.

Our solid-state relays for high switching frequencies guarantee the reliable and fast decoupling of signals. They can be used to implement extremely fast switching processes or to transmit signals with switching frequencies of up to 550 kHz.

12...28 V DC 100 kHz

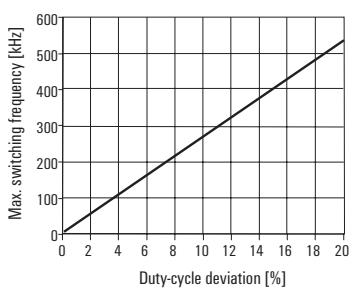

A special interior circuit in the opto module

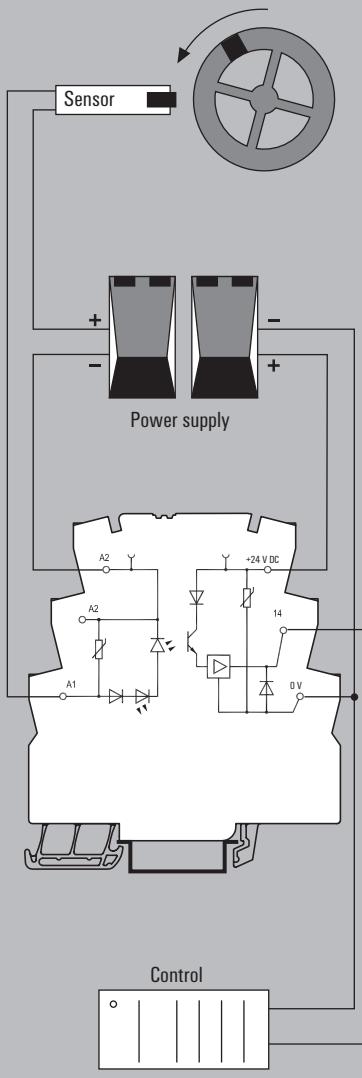

MICROOPTO 100 kHz ensures that rapidly transmitted signals are isolated from one another and that they can be transferred practically without delay. This allows switching frequencies up to 100 kHz to be achieved. Comprehensive suppressor circuits safeguard the module against conducted transients and voltage spikes.

Max. switching frequency is dependent on the duty cycle deviation

MOS 12-28 V DC 100 kHz (switching current 50 mA, ohmic load)

Applications

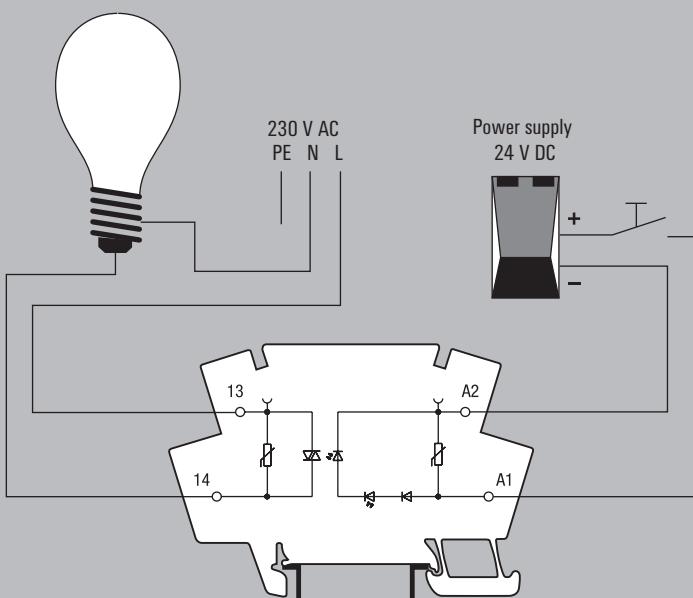

The **TERMOPTO** opto module is used in industrial applications in which electrical isolation and signal conditioning without switching amplification is sufficient.

The compact design in terminal-block format saves space on the rail and offers the option of a pluggable cross connection.

The choice between 10 input voltages and 3 output voltages as well as between screw or PUSH IN connection technology gives 60 variations for different applications.

The integrated protective circuit ensures sufficient protection in applications with resistive as well as slightly inductive and capacitive loads. For purely inductive, capacitive or comparable loads with high switch-on and switch-off peaks, such as solenoid valves or filament lamps, ensure that the module is dimensioned appropriately or an additional safeguard is used.

Signal adaption

Custom-fit relays for signal adaption and transmission

C

To adapt signals and transmit them from other systems at the panel level, relays and solid-state relays are required that are precisely tailored to the application. We offer you a range of high-quality and particularly space-saving relay products for these special applications.

In our portfolio you will find, for example, special variants for transmitting 5 V TTL signals to the inputs and outputs of PLC systems or industrial computers. What's more, we offer variants which, in contrast to conventional 1 NO contact solid-state relays, have a 1 CO contact output. These products are particularly suitable for inverting signals.

24 V DC / 5-48 V DC 0.5 A

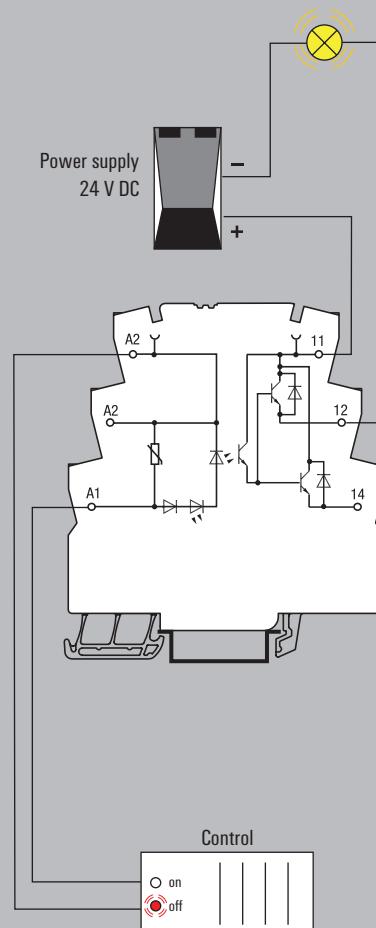

Electronic CO contacts are used anywhere output signals need to be changed over.

For this purpose, the input signal is directly switched through to the output side and inverted; as a result, the opto module can also be used as a pure inverter.

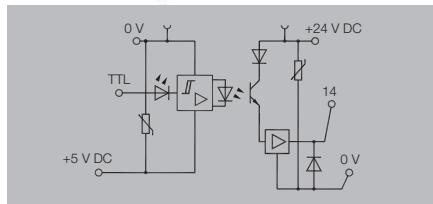

The advantage over electromechanical relays lies in the wear-free switching and the possibility of realising high switching frequencies.

Timing functions

Reliable timing relays for plant and building automation

C

Timing relays play an important role in many areas of plant and building automation. They are always used when switch-on or switch-off processes are to be delayed or when short pulses are to be extended. They are used, for example, to avoid errors during short switching cycles that cannot be reliably detected by downstream control components. Timing relays are also a simple way of integrating timer functions into a system without PLC, or implementing them without programming effort.

The Klippon® Relay portfolio provides you with relays for various timing functions such as on-delay, off-delay, clock generator and star-delta relays. We also offer timing relays for universal applications in factory and building automation as well as multifunction timing relays with several timer functions. Our timing relays are available as a classic building automation design, a compact 6.4 mm version and with wide-range multi-voltage input. Our timing relays have the current approvals according to DNVGL, EAC, and cULus and can therefore be used internationally.

TERMSERIES TIMER

Timing relay for control signal adaptation with additional functions

C

Timing relays are used to coordinate fast switching processes in control systems, among other things. TERMSERIES TIMER timing relays have a on-delay, which allows for the delayed switch-on of machines, the cascaded start-up of system components or the delayed activation of consumers such as pumps or valves. They also have the One Shot and blinker functions.

TERMSERIES TIMER timing relays in compact 6.4 mm terminal block format are available with either a screw connection or a PUSH IN wire connection. The timing functions and time ranges can be conveniently adjusted via the DIP switches on the side. The power supply and the respective switching status can be checked at a glance by means of the clearly visible duo LED on the ejection lever. International approvals in accordance with EN 61812 mean that they can be used anywhere in the world. TERMSERIES TIMER is compatible with the wide range of TERMSERIES accessories, thereby ensuring high levels of flexibility and simple integration into existing systems.

Your special advantages:

- Control voltage 24 V DC
- Empty socket for solid-state relays and electromechanical relays
- Simple adjustment of timing functions and time ranges
- Multifunctional design with three time functions: on-delay, One Shot and blinker

International approval

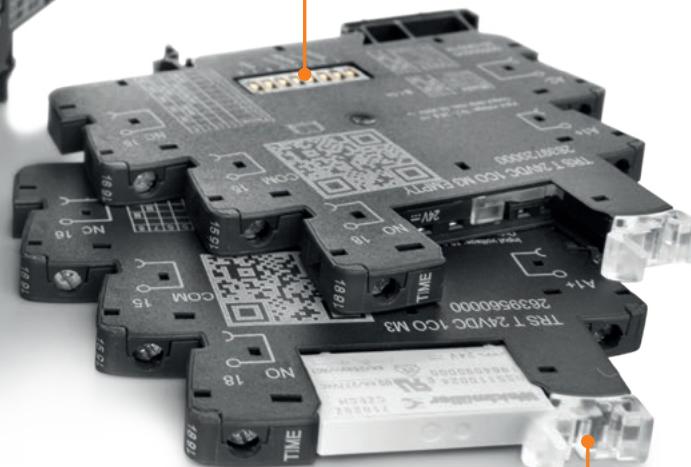

TERMSERIES timing relays comply with the requirements of EN 61812 and can be used anywhere in the world.

Available with screw connection and PUSH IN connection technology

Comfortable adjustment

Timing function and time ranges are easy to adjust via the DIP switches on the side.

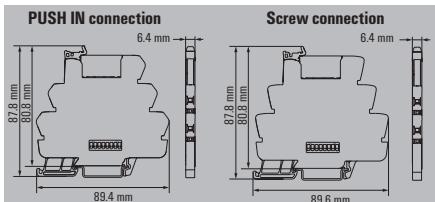

**Clear display**

Due to the integrated Duo-LED on the ejection lever, power supply and switching status can be checked at a glance.

TFI-SERIES

Compact timing relays for building and factory automation

C

Timing relays fulfil many functions in industrial environments. In automation technology, they are used to compensate for errors caused by excessive cycle rates. Among other things, short pulses are extended so that they can be reliably detected by downstream control components.

Our TFI-SERIES consists of five different devices covering the most important applications in building and factory automation. Four of these carry out individual functions: clock generator (pause and pulse start), star-delta switch, on-delay and off-delay with control input. There is also a multifunctional version with seven different timing functions. The timing functions and time ranges can be easily configured using a rotary switch fitted on the front. All of the devices meet the international standards according to EN 61812 and have UL approval for the North American market.

Your special advantages:

- Recessed setting potentiometers and status indication via LED
- Suitable for control voltages from 12/24 - 240 V UC and ambient temperatures from -25 °C to +60 °C
- Available in installation design and compact industrial design
- CE-compliant and UL-certified for international use

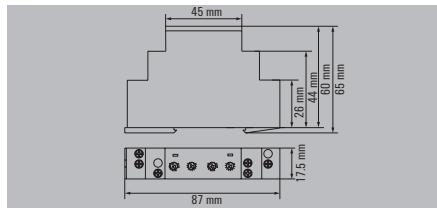

UL approval for the North American market

All timing relays have a cULus listing and can therefore be used on the North American market without any problems.

IT-TIMER

Compact multi-functional timing relay for easy control signal adjustment

C

In automation technology, timing relays are used to prevent malfunctions due to high pulse times. Among other things, short pulses are extended in order to be reliably detected by subsequent control modules. Various timing functions, such as on-delay, off-delay and clock generator, are available.

With IT-TIMER, Weidmüller's range includes a highly efficient timing relay with multi-voltage input that combines a range of functions with a compact size. It is particularly easy to configure the timing functions thanks to the flat front cover, the easy-to-read LED status indicator and operation with standard tools. IT-TIMER meets the requirements of IEC 618121. It is designed for an operating range from 24 V DC to 48 V DC or 24 V AC to 240 V AC and can therefore be used in a wide variety of applications.

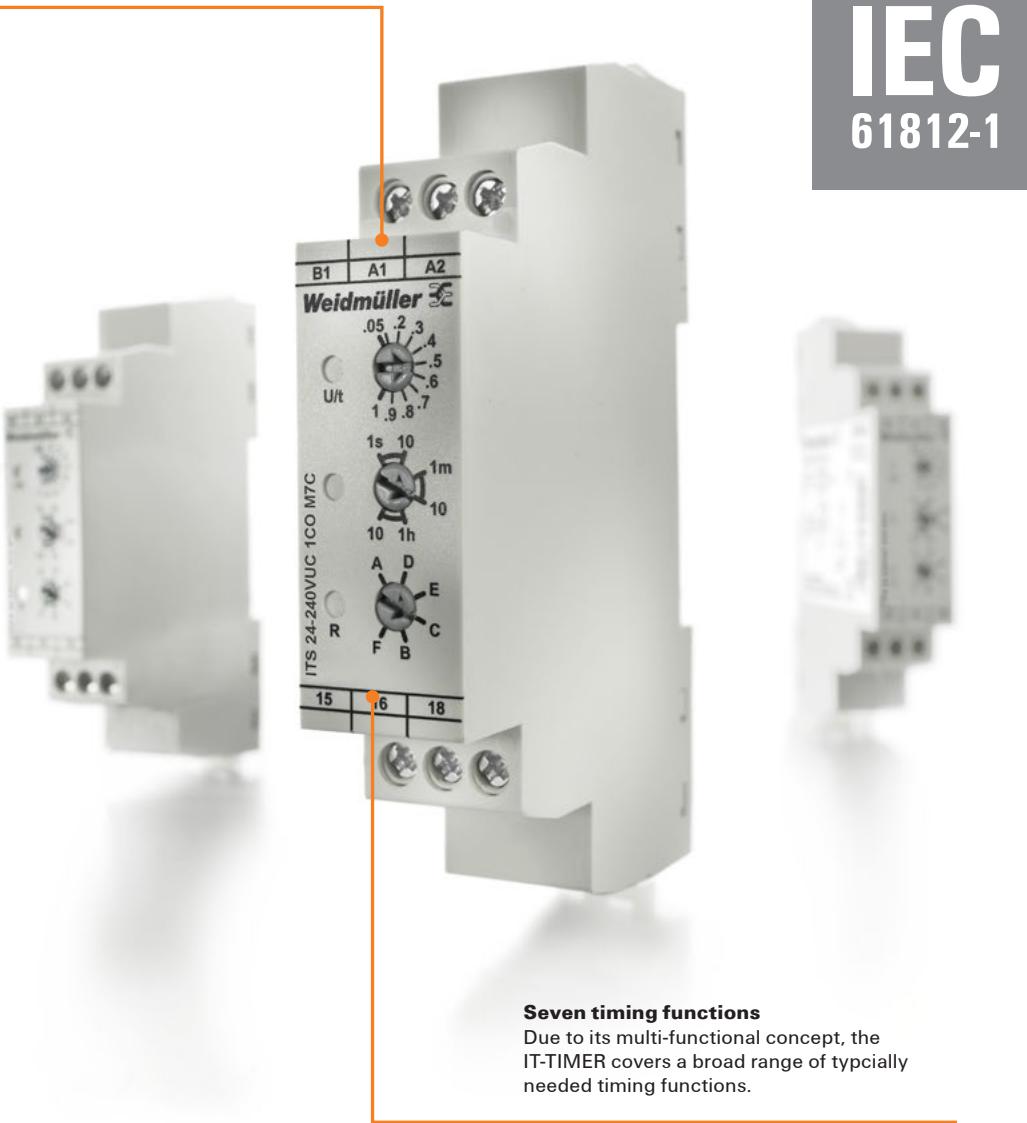

Your special advantages:

- High level of functionality in a compact size
- Timing functions that are easy to configure using standard tools
- Can be used internationally thanks to compliance with EN 618121
- Seven timing functions for a wide range of applications make the IT-TIMER a smart solution for your application

Multi-voltage input

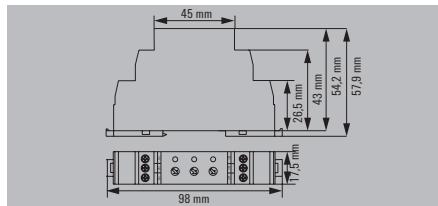

The timing relay operates from 24 V DC up to 48 V DC and from 24 V AC up to 240 V AC. It can therefore be used in a wide range of applications.

**Global standard**

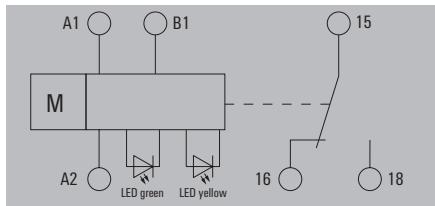

International usage is guaranteed in accordance with the standard IEC 61812-1.

Timing relay

- Multi-voltage input:
24 - 48 V DC
24 - 240 V AC
- Space-saving construction
- 7 time functions with separate control input

MCZ TO

The narrow pulse stretcher measuring just 6.1 mm wide

C

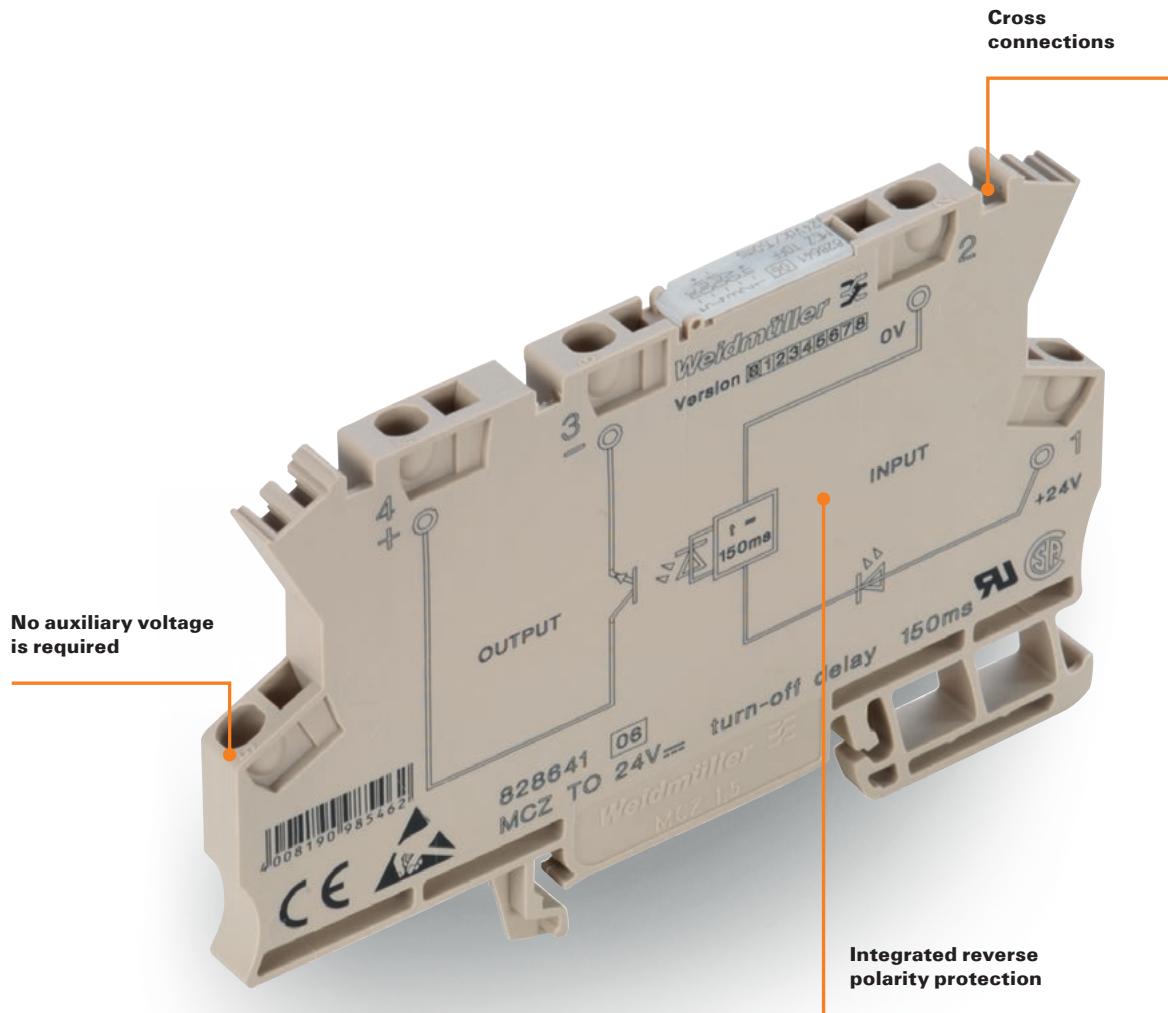

Pulse stretchers are used in automation technology to extend very short input pulses of less than 10 ms. Such short pulses are generated by light barriers, for example, and cannot be processed by conventional timing relays. The extended pulses, on the other hand, can be forwarded directly to the PLC.

MCZ TO is one of the narrowest pulse stretchers on the market. It extends even very short pulses ≥ 3.5 ms and has a fixed switch-off delay (50 ms or 150 ms). MCZ TO operates with low input power, and auxiliary voltages in the input and output are not required. It also includes a watchdog function with restarting of the off-delay. Precisely fitting accessories such as cross-connectors, markers and end plates make it flexible to use.

Your special advantages:

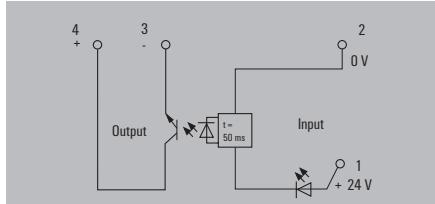

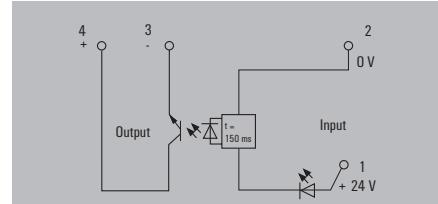

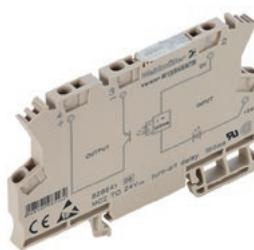

- Detection of very short input pulses (≥ 3.5 ms)
- Versatile to use thanks to three cross-connector connections
- Proven and reliable tension clamp connection system
- High level of safety thanks to integrated reverse polarity protection

MCZ TO

- Components for lengthening short pulses for the PLC
- Fixed switch-off delay
- Low input power
- Screwless
- Tension clamp connection
- Width 6 mm
- For mounting on TS 35

Functional safety

Relays for processing safety-related signals

C Industrial safety has become an important focus topic. There is an increasing demand for safety systems. At the same time, the demands placed on such systems are increasing. In order to provide optimum protection for plant, users, goods and the environment, dangers and incidents of all kinds should be avoided. This is also evident from the increasingly strict international standards and directives.

We have specially-developed safety relays for processing safety-related signals in our product range. They achieve a safety integrity level of up to SIL3 in accordance with EN 61508 and can therefore be used flexibly in the process industry.

Relay modules with positively-driven contacts

Relay modules with positively-driven contacts are used in safety-related applications to provide reliable feedback on the switching state of the operating contact to the control system. They enable safe diagnosis via a positively-driven NC contact and ensure the reliable exchange of signals between two systems with feedback function. In elementary relays with positively-driven contacts, NO and NC contacts are mechanically connected to each other. This means that NO and NC contacts can never be closed at the same time, so that a diagnostic coverage of 99 % is achieved.

SAFESERIES SIL relays

Functional safety for process applications

C

Whether for a burner control system, secure emergency shut down or, for example, for pump controllers – our safety relay guarantees safe conditions and convince with superior and significant features.

Their integration into distributed control systems (DCSs) is even better, with an input filter which makes the SIL circuit immune to the test impulse which is typically used by a DCS. You will also benefit from simple maintenance: the fuses are accessible from the outside and can easily be changed. You can see the status of the safety and the monitoring devices clearly with status LED on the device.

All devices are accredited through certification by the internationally recognised TÜV-NORD group – for secure process applications around the globe.

Safe control of back-up systems

Equipped with wide range input voltages in the monitoring circuit from 24 V AC/DC to 230 V AC/DC, the relay is designed for individual use, e.g. in back-up systems or the overfill prevention devices of tank farms.

Safe activation and deactivation

This universal device can be used for either the energise-to-safe or de-energise-to-safe operation modes, as you wish. This makes it suitable, e.g. for pump controllers or extinguishing systems.

Safe monitoring of furnace firing systems

The feed-in of fuel must be interrupted as soon as a boiler plant reaches any safety criterion limits. The SAFESERIES offers you a safety switch-off for the feed-in of fuel to furnace firing systems up to safety integrity level (SIL) 3.

You have strict requirements for the functional reliability of your systems

We connect your safety-related applications reliably

C

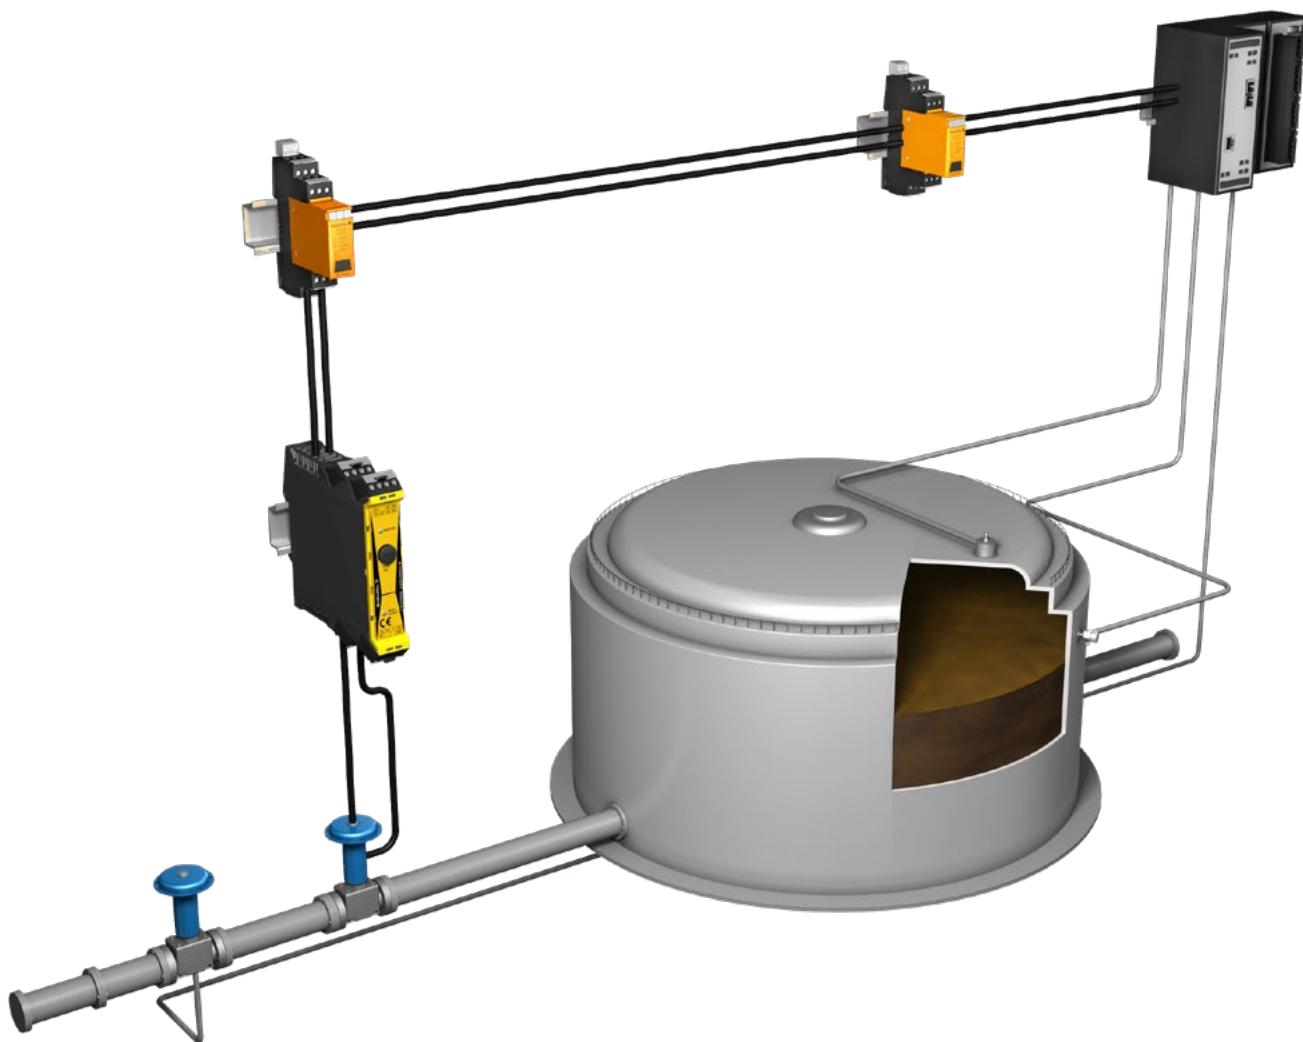

Safe process and power technology is a top priority for you. For example, a reliable emergency shutdown, which initiates appropriate countermeasures in hazardous situations, is indispensable. These might extend to the automatic shutdown of the system or subsystems within it.

As a specialist in industrial connectivity, we offer a comprehensive solution for safety-sensitive areas, from the control room through to the field.

The SAFESERIES SIL relay is ideally suited for use in safety-related applications. It is designed for low and high demand modes.

With the wide voltage range input in the monitoring circuit of 24 V UC to 230 V UC, for example, you can control back-up systems with high DC voltage. You get additional flexibility for your applications with the optional "G3" coating for use in harsh environments.

The safe and reliable coupling of measuring instruments, actuators and sub-assemblies to the safety-relevant signal circuit is handled by our VARITECTOR SPC, the lightning and surge protection for signal circuits. Certified for safety requirement level SIL 3 according to EN 61508, and accredited by TÜV NORD, it can easily be incorporated into your safety calculations.

SAFESERIES

- Certified to EN 61508 for SIL3
- Wide voltage input from 24 to 230 V AC/DC for the monitoring of field signals
- Variant with G3 protection for extreme conditions
- Other variants for burner management or on/off switching

VARITECTOR SPC

- 2 analogue or 4 digital signals on a width of just 17.8 mm
- Monitoring with status indicator and message function
- Testable with V-TEST according to IEC62305
- Variants with SIL certification or EX approval

SIL-Relays of the SAFESERIES

in combination with distributed control systems

C

A distributed control system is characterised by a high availability of hardware and software components. Weidmüller offers for the customer the advantage that his safety relays are working reliably with different distributed control systems, proven by extensive integration tests.

Signal monitoring in safety-critical circuits

Relay modules with forcibly guided contacts

C

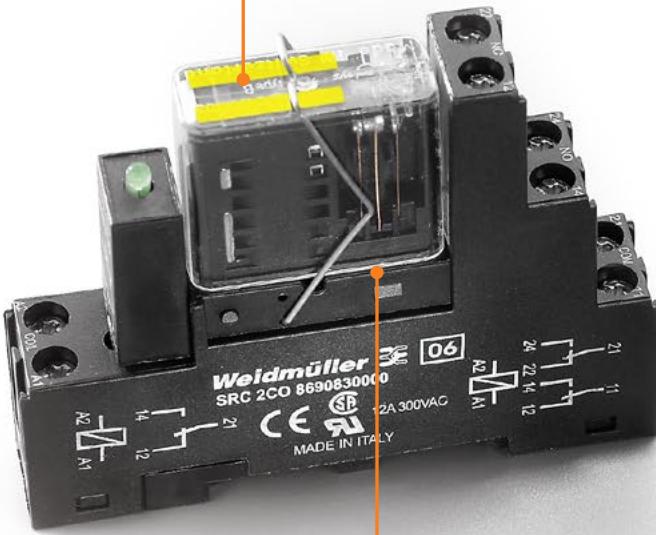

Weidmüller has expanded the RIDERSERIES to include a relay variant with forcibly guided contacts. Relays with forcibly guided contacts have a 99 % diagnostics coverage and an excellent reputation for use in safety systems.

The contacts interlock mechanically with each other in order to ensure a synchronous switching status of both contacts. This guarantees that the alert contact will maintain the same switching status in the event of an error (for example, if the working contact welds from an overload). The controller (or safety controller) detects the alert contact and then compares the set values and actual values. If a difference occurs, measures can then be taken to protect equipment and human life.

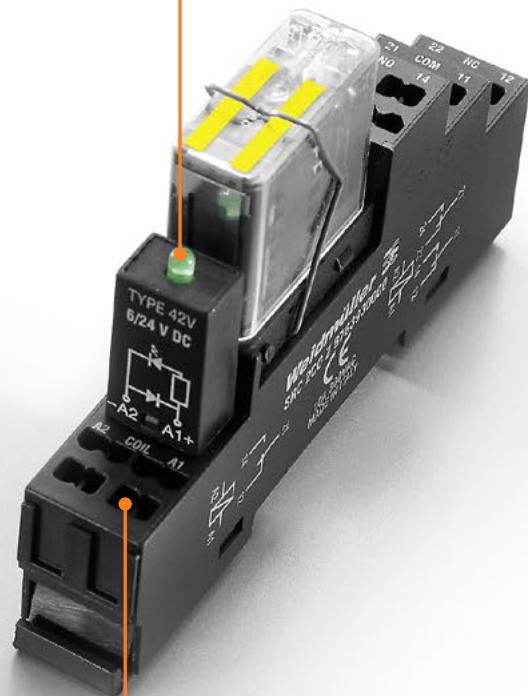

Convenient

Relay modules can be replaced quickly in the event of a fault without removing the connecting cable.

**On site diagnostics**

An easy to view Status LED with an integrated free wheeling diode is used to protect the series connected electronics.

**Resistant to vibration**

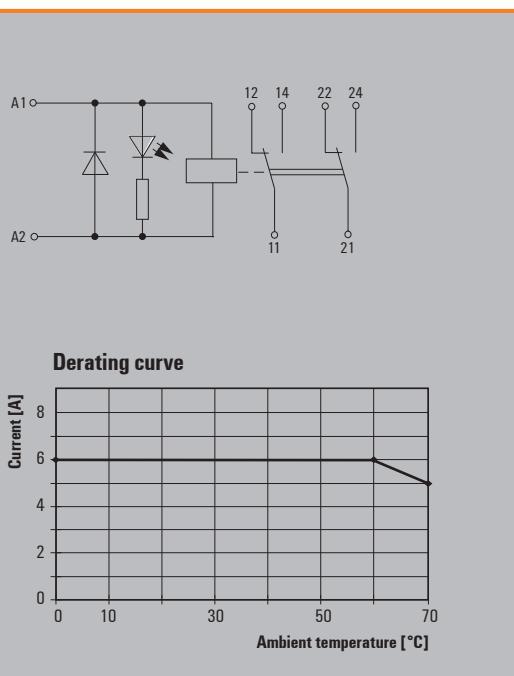

A metal clip ensures that the relay module remains secure even under vibration / mechanical shock conditions.

A variety of connection options

The socket is available either with the proven screw clamp connection or the time saving tension clamp connection.

RCI KIT with forcibly guided contacts**2 CO DC coil**

TERMSERIES FG

Proven switching condition monitoring of signals

C

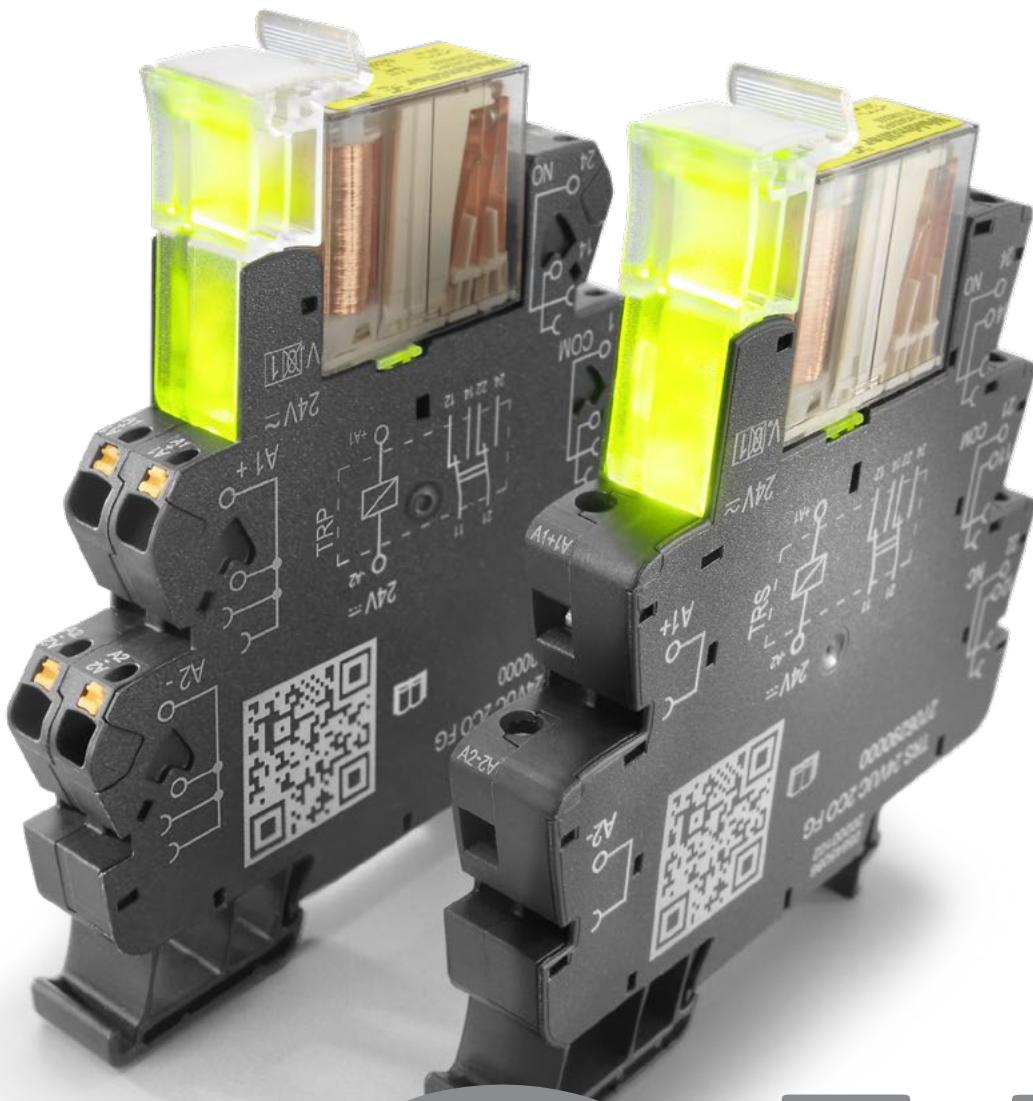

In safety-related applications, relays with positively-driven contacts have proven themselves many times over. The positively-driven operation ensures a synchronous switching status at both contacts, so that the signal contact maintains the same switching status in the event of an error. Thus, diagnostic coverage of 99% is achieved.

Our TERMSERIES relay modules are predestined for secure signal monitoring in a wide range of applications. Their switching function is clearly indicated by an illuminated ejection lever, which also has an integrated marker holder. Compatibility with all accessories from the TERMSERIES allows high flexibility and easy integration into existing systems. TERMSERIES relay modules have the cULus certification required for use in the North American market.

Your special advantages:

- Relay modules for monitoring signals for opening failure
- Two positively-driven CO contacts in accordance with EN 61810-3 type B
- Optional with screw and PUSH IN connection
- “cULus Listed” certification for use in the North American market

S

TERMSERIES FG

Complete module with relay

- Space-saving 12.8 mm width
- AgNi contact
- Bright shining status LED
- With protective circuitry
- PUSH IN and screw connection

C

Technical data**Load side**

Rated switching voltage / Continuous current	250 V AC / 6 A
Max. switching voltage, AC	250 V
Inrush current	
Min. switching power	10 mA @ 5 V
Contact type	2 CO contact positively-driven (EN 61810-3 type B) (AgNi)
Mechanical service life	10 x 10 ⁶ switching cycles
Max. switching frequency at rated load	0.1 Hz

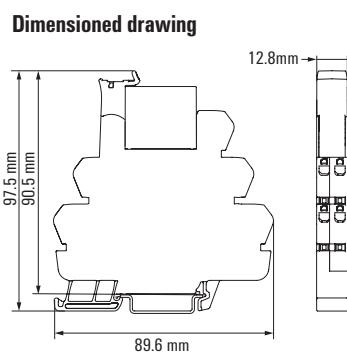

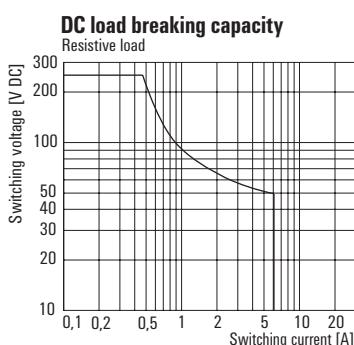

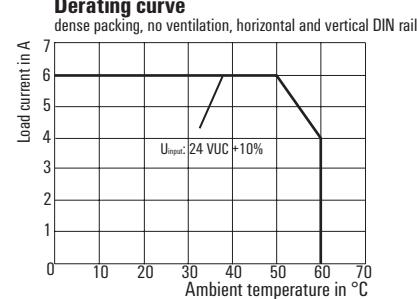

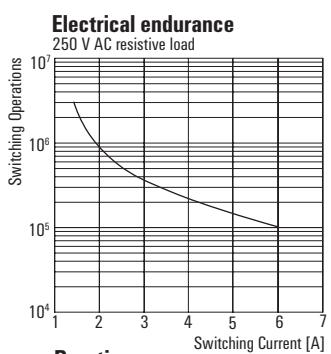

General data

Ambient temperature (operational)	-25 °C...60 °C
Storage temperature	-25 °C...70 °C
Humidity	5...85 %, no condensation
Approvals	CE; cULus; EAC

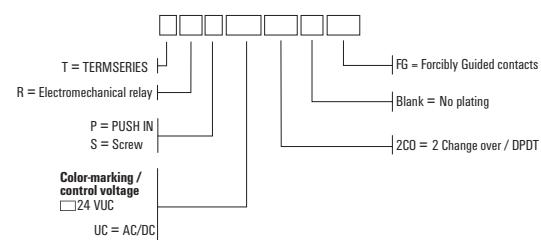

Insulation coordinates

Rated voltage	300 V
Impulse withstand voltage	
Dielectric strength, Input/Output	3.51 kV _{eff} / 1 min.
Dielectric strength of neighbouring contacts	2.21 kV _{eff} / 1 min
Dielectric strength to mounting rail	3.51 kV _{eff} / 1 min.
Creepage and clearance distance input - output	≥ 6 mm
Overvoltage category	III
Pollution degree	2

Dimensions	PUSH IN	Screw connection
Clamping range (nominal / min. / max.)	mm ²	1.5 / 0.14 / 2.5
Depth x width x height	mm	87.8 / 12.8 / 97.5

Power

Special relays for high industrial loads

C

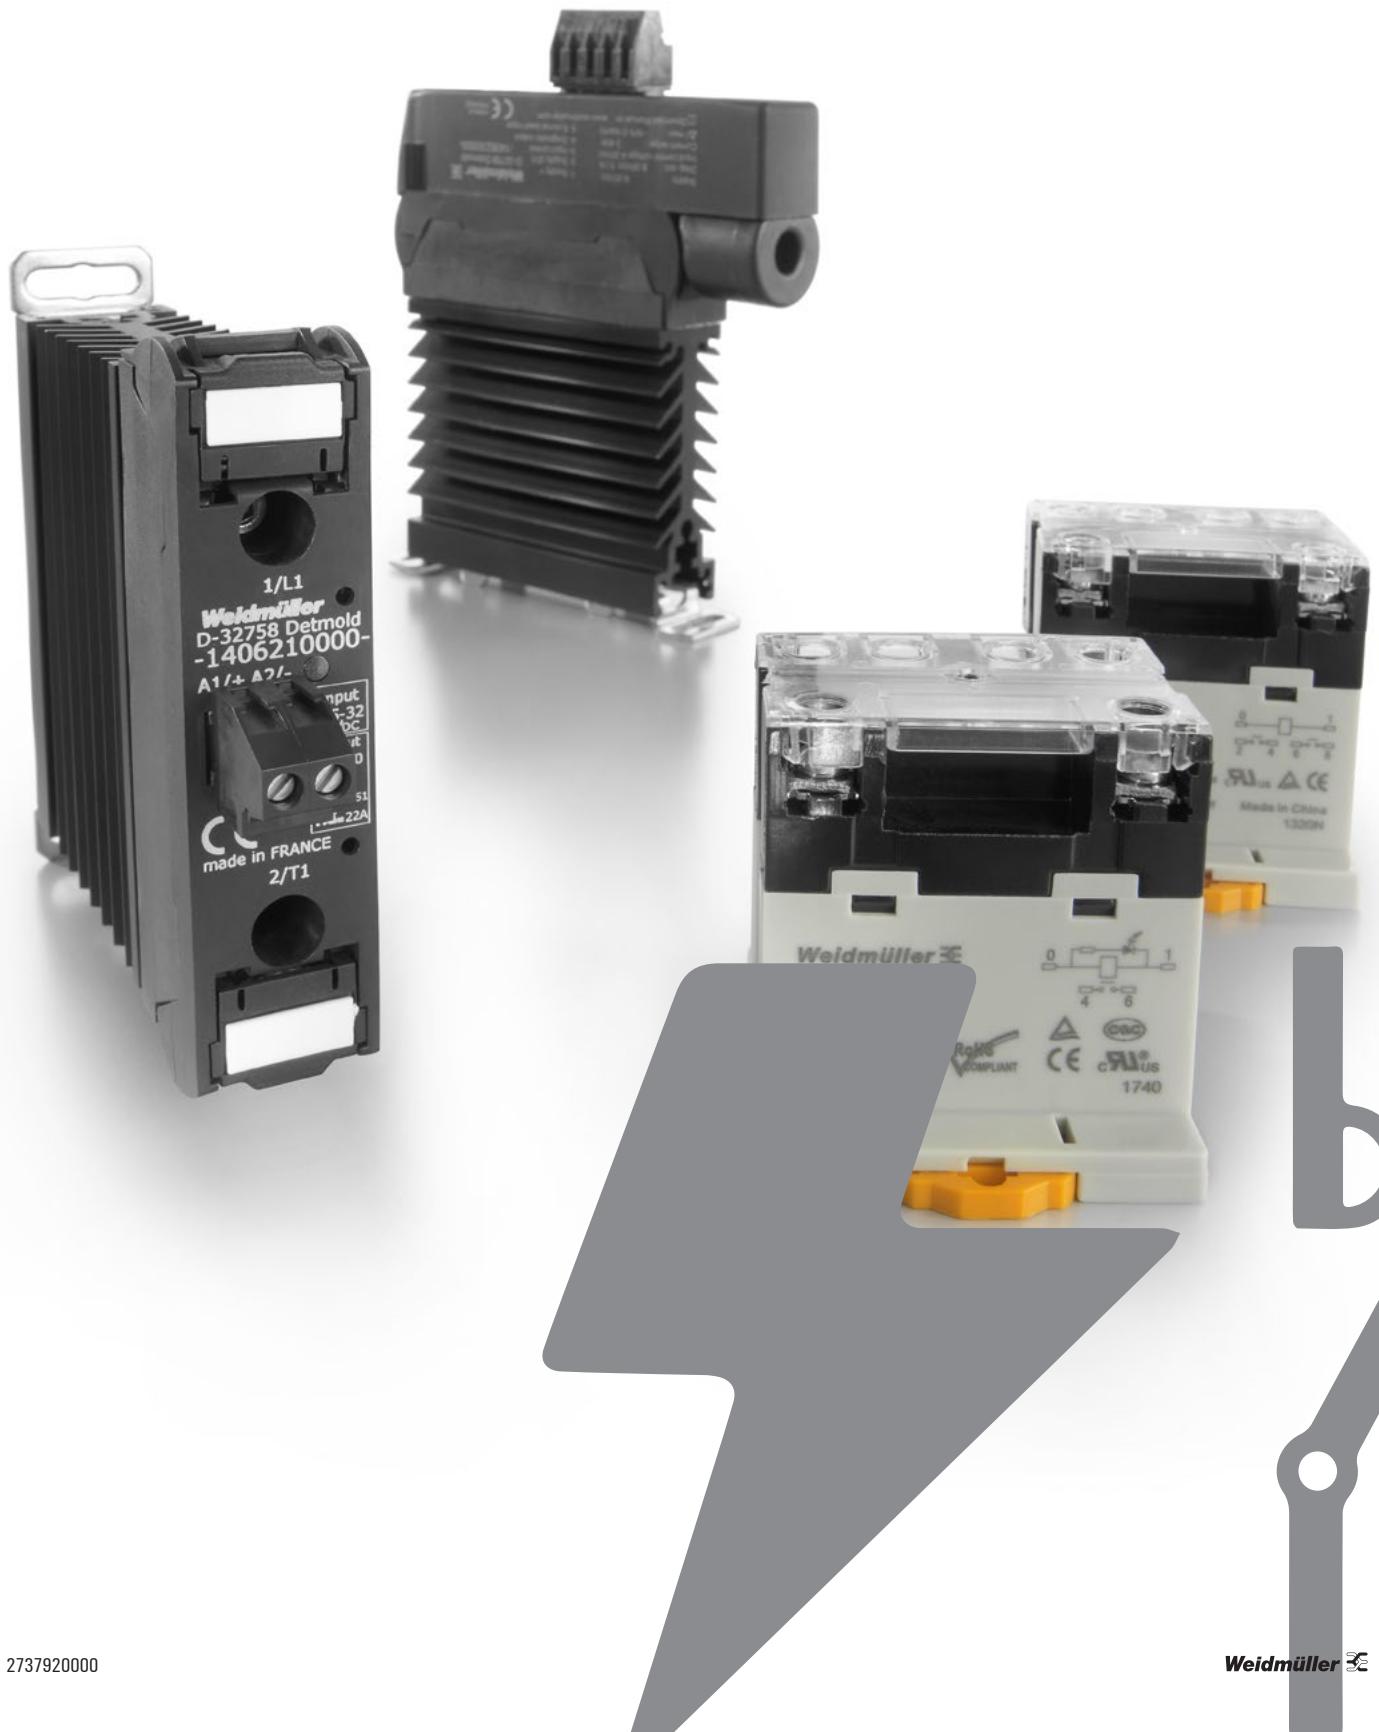

If currents above 10 A have to be switched, standard relays are subject to high wear and quickly reach the limits of their service life. Our power switches has been specially developed to control high AC loads. They are ideally suited for motors or heating elements up to 75 A and can be used in many other power applications.

Power solid-state relays (PSSR) up to 75 A

Our solid-state contactors are far superior to mechanical contactors. They achieve higher switching speeds and are more robust and durable. They switch ohmic and inductive loads silently, wear-free and reliably – even in dusty or chemically aggressive atmospheres. Our solid-state contactors are available for 1- and 3-phase mains.

Miniature contactors (PWR) up to 30 A

Conventional contactors are oversized for some power applications in which industrial relays wear quickly and only achieve a short service life. This is where our PWR miniature contactors are used. Thanks to switching currents of up to 30 A, a double-break contact and a significantly larger contact gap, they are able to switch industrial loads reliably.

Power solid-state relays

Switch high AC loads up to 75 A completely wear-free and noiseless

C

Due to their high shock and vibration resistance, the large switching current and the option of simple fusing, our power solid-state relays outperform by far any electromagnetic relays, especially in the process industry.

The compact modules need just a low control power at the input, have fast response times and operate noiseless. The optional 1PH-Control-Unit allows the current monitoring of up to five parallel connected loads.

Our new power solid state relays are ideally suited for a multitude of diverse tasks: switching of pipe heaters and infrared heaters, or permanent current monitoring.

High current load integral

The high current load integral I^2t of 6,000 A²s allows affordable device protection using standard circuit breakers for variants with 35 A load current.

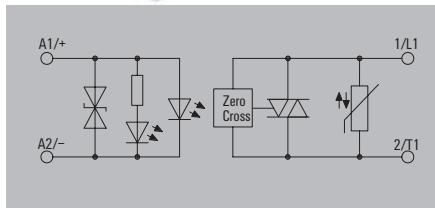

Simple current monitoring

The optional, plug-on monitoring module warns when current drops by 16 % or more. Short-circuit, line-break and defective loads are detected.

High output current
Ideal for controlling pipe heaters due to the high output current of 50 or 75 A. The compact design allows direct mounting at application site.

PSSR - 1-phase

- Single-phase load circuit: 12–275 V AC / 25 A
- Ready-to-use: snap on - connect - ready
- Zero-cross switch
- Noiseless, wear-free switching
- Attachable monitoring module

Service and support

Service and support	Our expertise for your requirements	V.2
	Engineering support and customised assembly	V.3
	Personal Support	V.4

Our expertise for your requirements

Service connects – worldwide

Automation technology functions are becoming more complex in a globally-oriented world facing ambitious targets in terms of energy efficiency and smart production. We are your equal partners for the best connections in Industrial Connectivity.

Our personal support can answer any questions reliably and expertly. Our online services are available 365 day a year around the clock to provide answers to your questions on our products – from user documentation through software to planning tools.

In short: Weidmüller's global service combines our expertise with your requirements.

Engineering support and customised assembly

Automation engineering and connectivity consulting belongs to our services as well as assembly of engineered products. We also support the process from the idea to the product with our Weidmüller Configurator and the Configure-to-Order process.

Consulting and engineering

The challenge for you is reducing costs and increasing efficiency. This requires intelligent, individual solutions. Whether it is modified products, pre-fitted mounting rails or complete small cabinets – our application centres provide a highly qualified custom-made engineering and production service.

Connectivity Consulting

Alongside our product offering, we support you with our range of services through all the phases of machine construction. The result of this collaboration is a reduction of up to 30% in cycle times, up to 20% more space in the control cabinet and significant fault reduction. Our experienced Connectivity Consulting team delivers a practical impetus rather than just abstract theories.

Fitted mounting rails

Your processes in panel building have to be fast, flexible and productive. This is the only way you can cut your costs and increase efficiency. Depending on the application in question, you will have different requirements with respect to the engineering service, delivery speed and flexibility to be provided.

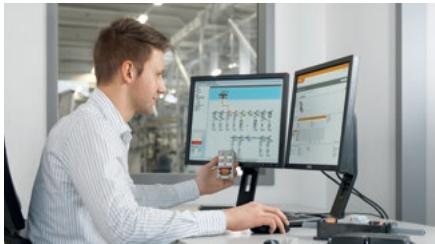

Processed and assembled enclosures

To compete internationally, your plants need to satisfy high standards of safety, quality and performance. The smart combination of consultation, application expertise and industry know-how is our key to finding a custom-fit solution for your application. Reduce costs and increase efficiency

Technical downloads

All information, such as technical data, manuals, certificates and much more for the appropriate use of our products and solutions in your application

Engineering data

For the quick integration of our products into your design, there are a lot of digital product data for engineering systems like EPLAN, Zuken E3.series, WSCAD and many others available for download.

Product software

Our software makes using and configuration of our products easier for you when it comes to operation, configuration and monitoring

Approvals, certificates & declaration of conformity

We supply product- or company-related approvals and certificates for your documentation

Security advisory board

Our Product Security Incident Response Team (PSIRT) continuously informs you about possible security-related vulnerabilities of our products

Relay modules and solid-state relays – Introduction

Our relay modules, solid-state relays and additional value added services are hugely beneficial for our customers: space-saving installation, control cabinet optimisation, reduced wiring effort, optimal markability and cost reductions. Supplemented by our complete portfolio, Weidmüller offers everything from a single source. Over the following pages, we would like to explain the world of relay modules and solid-state relays and provide technical explanations of the features in the data sheet.

There are three main applications for relay modules and solid-state relays, which we will explain briefly below:

Potential isolation

Many applications require that the control circuit is electrically isolated from the load circuit. This primarily protects the control level from interference from the field, such as:

- Interference currents e.g. from earth and ground loops
- Interference pulses e.g. from inductive effects of transients

Switching amplification/signal adaptation

The separation of the load and control circuits, in conjunction with the associated options for configuring both circuits separately, means that relay modules and solid-state relays are often used for switching amplification and signal conditioning purposes.

This allows the different voltage potentials of signals from the control and load circuits to be aligned.

They are also used to amplify current values that exceed the load capacity of the control unit, e.g. a PLC output.

Contact multiplication

With applications, it is often necessary to control several load circuits simultaneously with one control signal.

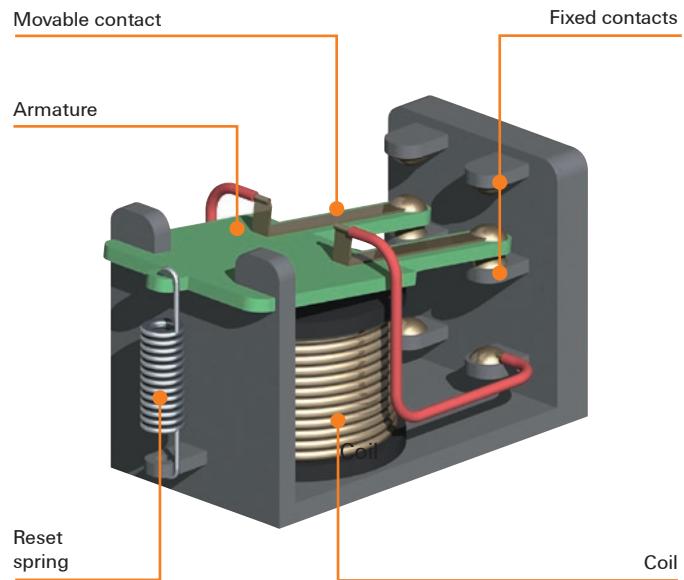

With electromechanical relays, this can be achieved with multi-channel variants, whereby up to four load circuits can be switched simultaneously with one control signal, e.g. using a 4 changeover output.

In addition, multi-channel relays can be used, whereby one of the channels is used to switch the load and another channel is used to return a feedback signal on the switching status of the output to the upstream control unit.

Relay modules and solid-state relays – Comparison

Advantages of electromechanical relay modules (EMR)

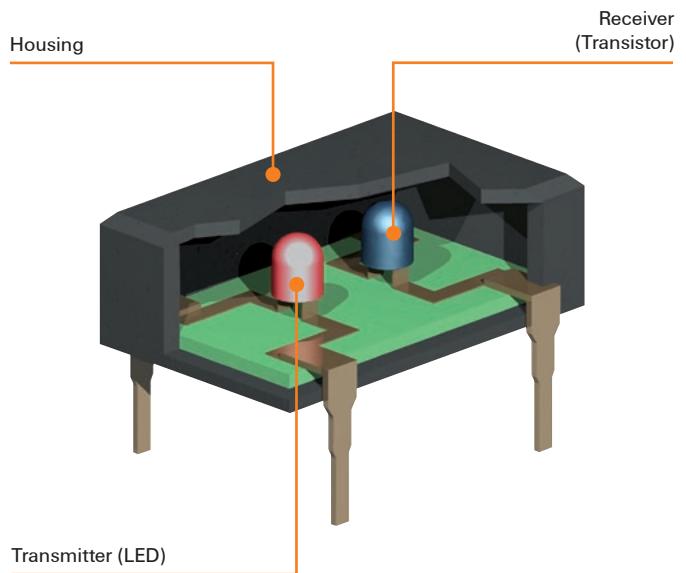

- AC and DC operation in load circuit possible
Versatile (advantage as interface between different plant equipment)
- No leakage current in the load circuit
A semi-conductor does not achieve 100 % isolation
- Low residual voltage in the load circuit
Low voltage drop
- Significantly lower power loss in the load circuit
In contrast to the semiconductor in the opto module, there is very little electrical resistance in the contacts of the electromechanical relay, which can lead to a rise in temperature when under load. Therefore, heat sinks are not required.
- Contact multiplication possible
A single control signal can switch several load circuits
- Control circuit insensitive to voltage peaks
The switch-on power of the magnetic coil prevents unintentional switch-on due to voltage couplings.

Depending on the requirements, the choice between electromechanical and solid-state relays is made based on the different advantages that the different versions offer:

Advantages of solid-state relays (SSR)

- Longer service life and increased reliability
No moving parts or wear on the contacts
- Small dimensions
Saves space on the PCB and mounting rail
- Low control power
An LED is activated - no mechanical parts are moved
- Fast response times
Fast switching, which allows high frequencies to be achieved
- No contact bounce
Reduces switching delays
- No switching noise
Suitable for use in noise-sensitive environments
- Not susceptible to shock and vibration
Prevents unwanted switching statuses
- No electromagnetic radiation due to switching sparks or coils
No interference of adjacent assemblies or electronics components

Relay modules – Overview

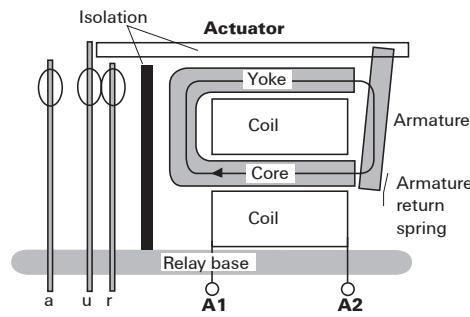

Historical background

The term 'relay' was originally used for a station where stagecoaches were able to change their tired horses for fresh ones. The term 'relay' was given a totally different meaning by the English physicist Charles Wheatstone (1802–1875). In Wheatstone's times, departing trains were advised of by a bell ringing at the next railway station up the line.

This was achieved by connecting a battery in the first station to a bell in the second. However, as the railway stations were generally several kilometres apart the power arriving at the second station was often insufficient to ring the bell. Wheatstone invented a switchgear apparatus that was installed at the second railway station. This continued to function even with low power supply levels. The switchgear apparatus switched a second electrical circuit that actuated the bell. This was the birth of the electromagnetic relay.

How a relay functions

A relay is an electromagnetic switch comprising of two galvanically isolated circuits. Firstly the control circuit and secondly the open circuit with the normally open contact. As soon as the control circuit is energised, the coil creates a magnetic field in the core/yoke and attracts the armature. The actuator now actuates the switch at the output, the normally open contact (make contact) closes and the normally closed contact (break contact) opens. When the control circuit is turned off, the magnetic field diminishes and the return spring returns the armature to its initial position. The actuator moves the normally open (make contact) back to its normal position, the normally open contact opens, the normally closed contact (break contact) closes.

A relay therefore offers the option of switching high loads with low power, such as battery voltages, and acting as a switching amplifier. Thanks to the galvanic isolation between input and output, a relay is also suitable for providing isolation in the event of potential differences between the control and operating circuits. If a relay also has several working contacts, it can also be used as a contact multiplier.

From relay to relay module

There are two alternative methods that make a relay module suitable for use in industrial applications: mounting onto a PCB – in combination with the corresponding assembly techniques and circuitry – or plugging onto a specially designed relay socket.

Generally, the design and rating data determine if a relay module is or is not suitable for a particular application.

For example, relay modules with plugged on relays are only partly suitable for use in applications subjected to heavy vibrations. In this case, relay modules with soldered relays should be preferred. Low, compact designs such as those provided by the RIDERSERIES are utilised in small consumer units where the overall available height is limited. Conversely, the compact design of the TERMSERIES helps to save space in electrical cabinets.

Relay modules – Switching loads

Electromechanical relays are a varied and cost-effective solution for a wide range of switching processes. They can be used for level and power adaptation and form interfaces between control, signalling and regulating equipment and peripherals. In spite of rising raw material prices, they are still very inexpensive and can be easily integrated into a wide variety of circuit types.

Relay modules from Weidmüller are extremely reliable, durable, and available in many different designs. The diversity of their applications in the various industrial sectors makes it necessary to select a suitable relay for each specific application. The following applies: Due to their design, relay modules are subject to mechanical and electrical wear, which must be taken into account when relay circuits are set up. Electrical consumers always form a mixed load with resistive, capacitive and inductive components, although consumers with a large inductive component are predominantly used in practice. These include contactors, solenoid valves, motors etc. We will take a closer look at these areas of application over the following pages.

Switching of large AC loads

If large AC loads are switched, the relay can in principle be operated until the specified maximum value of switching voltage, current, or power is reached. However, when switching AC loads, the switching voltage has a much smaller influence on the service life of the relay contact than the switching current. The reason for this is that the arc that occurs when the relay is switched off usually extinguish automatically at the next zero crossing of the load current. In applications with inductive loads, an effective protective circuit should be provided, as otherwise a significantly reduced service life can be expected.

Switching of large DC loads

Relays can only switch off relatively small direct currents because the zero crossing for extinguishing the arc is missing here. The maximum direct current value is also dependent on the switching voltage as well as on design conditions such as contact gap and contact opening speed. Corresponding current and voltage values are documented in load limit curves.

With undamped inductive DC loads, these values are lower because the energy stored in the inductance can ignite an arc that carries the current through the open contacts. The resulting arc significantly reduces the service life compared to an resistive load.

An effective contact protection circuit can increase the service life of the contacts by 5 to 10 times compared to inductive loads that are not or unfavorably protected. Type 1N4007 freewheeling diodes are preferably suitable for this purpose.

Switching of very low power circuits

Low power circuits with values below 30 V/10 mA are mainly used in applications where signals has to be transmitted to control inputs, e.g. to a PLC. Such low loads do not produce a sufficient arc at the contacts.

However, this arc has two important functions: On the one hand, it ensures continuous cleaning of the contacts; on the other hand, it can penetrate non-conductive foreign layers at the contacts. Such foreign layers are usually created by oxidation or sulfidation of common contact materials such as silver (Ag), silver-nickel (AgNi), or silver-tin oxide (AgSnO). The foreign layers can increase the contact resistance after a short time to such an extent that reliable switching of low loads is no longer possible.

For these reasons, gold (Au) is used as the contact material for relays switching small loads. It has proven itself due to its low and constant contact resistance and its resistance to ambient air containing sulphur.

Solid-state relays – Overview

Solid-state relays - functionality

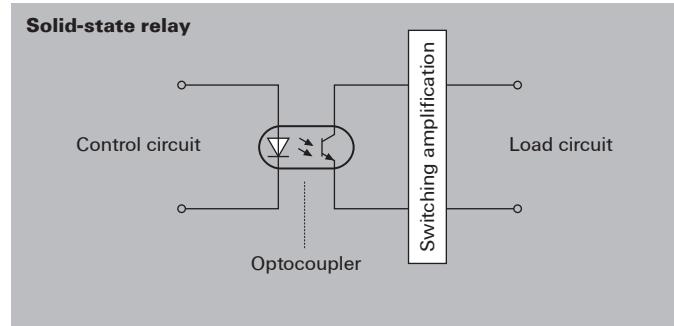

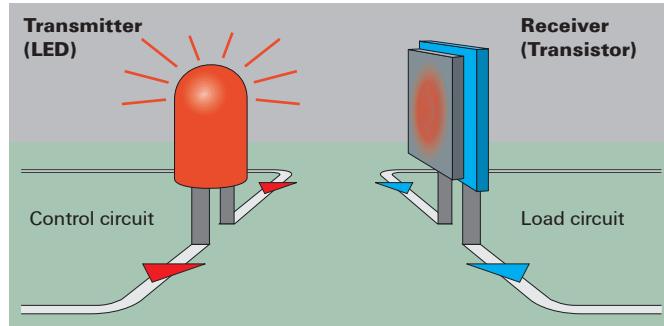

Solid-state relays are electronic components (switching elements) that are used to switch a load circuit via a control circuit. First of all, they allow applications with varying power ratings to be switched with relatively minimal switching currents. Secondly, they provide galvanic isolation for the switching and load levels in order to protect components in the event of malfunctions.

In contrast to electromechanical relays, solid-state relays do not have any mechanical parts prone to wear. The core element of a solid-state relay is an optocoupler. In an optocoupler, a light signal is triggered in the control circuit for the switching process via an LED, which causes a light-sensitive semiconductor receiver to close a connected load circuit to switch on the downstream switching amplifier. The transmitter (LED) and receiver (e.g. a phototransistor) of the optocoupler are embedded in a light-conducting plastic material and surrounded by a light-proof casing that protects against outside influences.

Switching amplification is required because optocoupler can only switch comparatively small voltages and currents. The combination of an optocoupler with the switching amplification at the output means that this is now called a solid-state relay.

The output of a solid-state relay

A voltage range is usually specified for the nominal switching voltage of solid-state relays (e.g. 5 ...48 V DC), which must neither be exceeded nor fallen short of. The same applies to the continuous current. Frequently exceeding this value can lead to premature wear and to destruction of the semiconductor. Short surge voltages (voltage peaks) are eliminated by appropriate protective components such as diodes or varistors. Depending on the output circuit with the appropriate amplifier semiconductor, either AC or DC loads can be connected

DC output:

For the control of DC voltage switching and control devices, a switching amplifier for switching the DC voltage is connected downstream of the optocoupler (bipolar transistor or MOSFET). For DC outputs, the specified polarity must be observed.

2-pole DC outputs can be used as both positive and negative switching outputs unless otherwise specified. The abbreviations NPN (negative switching output) or PNP (positive switching output) are often used for these terms.

With the 3-pole DC connection, the output circuit is provided with an auxiliary voltage which is used for more precise control of the amplifier transistor.

Some applications also require this auxiliary voltage for very fast switching, e.g. of very high frequencies. These outputs are often only positive switching (PNP) or negative switching (NPN) outputs and cannot do both. This is then specified in the instruction sheet or in the data sheet for the respective product.

**Bipolar transistor (for DC outputs)**

For use at low currents (≤ 0.5 A) due to having a higher power loss than MOSFETs. However, cheaper than MOSFETs.

**MOSFET (for DC outputs)**

For use with load currents.

The low contact resistance of the MOSFET generates only very low power loss. Furthermore, a MOSFET output has only very small leakage currents ($< 10 \mu\text{A}$).

AC output:

For the control of AC switching and control devices, a switching amplifier for switching the AC voltage is connected downstream of the optocoupler (TRIAC or thyristor).

Switch-on behaviour of an AC output:

Most solid state relays with triac or thyristor outputs are zero-voltage switching outputs. This means that once a control signal has been applied at the input, they switch on at the next zero crossing of the AC voltage at the output. However, this behaviour makes these outputs relatively slow in their switch-on behaviour (up to 10 ms delay time at 50 Hz mains frequency of the switched voltage).

To improve this, some AC outputs have an instantaneous switching output. These outputs switch on as soon as possible after a control signal is applied to the input (< 0.1 ms). However, depending on the phase position, this can cause high current peaks when switching on, and can cause the electromagnetic interference emissions in the system to increase.

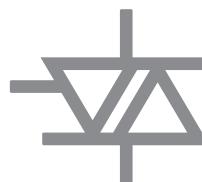

Switch-off behaviour of an AC output:

Semiconductor outputs for AC voltages with triac or thyristor all switch off at the next zero crossing of the output current once the control signal has been removed at the input. As a result, they cannot be used for switching DC voltages.

**Thyristor (for AC outputs)**

For use with load currents.

The function of a thyristor is comparable to that of a one-way diode. For alternating currents, an anti-parallel connection of two thyristors is therefore used.

**Triac (for AC outputs)**

For use with load currents.

A TRIAC combines the functional principle of anti-parallel connected thyristors in a single component.

Solid-state relays – Switching loads

One particular challenge for the circuits in the load circuit of optocouplers and solid-state relays is posed by the different load types of the possible applications (resistive, inductive, capacitive load). Depending on the application, it is important to be aware of the effects that these loads have on the module being used, and how an appropriate protective device needs to be designed.

In general, it must be ensured that the power loss at the amplifier semiconductor does not exceed a permissible limit value over a long period of time. This would lead to overheating and finally to the destruction of the component.

Switching resistive loads

Because the current strength in the load circuit and the voltage across the amplifier semiconductor are inversely proportional to each other with resistive loads, these types of loads do not usually pose a problem. In this case, it is sufficient to observe the maximum current and voltage strengths of the modules.

One particular case is the switching of incandescent bulbs. Due to the low cold resistance, overcurrents of 10 to 20 times the operating current can occur when switching on. The components must be designed for these possible overloads, which correspond to the effect with a capacitive load.

Switching capacitive loads

Capacitive loads occur when there is a capacitor in the load circuit. This acts as a short circuit at the moment of switch-on, causing a high inrush current.

Compared to many other electromechanical relay modules, an amplifier semiconductor is more robust against very short current peaks (< 10 ms) when switching on capacitive loads, because it does not contain any mechanical parts that can weld together. Inrush current peaks that are too high, too steep or too long can still lead to the destruction of the amplifier semiconductor.

Switching inductive loads

With inductive loads, which are mainly present when coils are used in the load circuit, the problem arises when switching off. Due to the current flow in the coil, a magnetic field builds up which then suddenly collapses and generates a high induction voltage. An amplifier semiconductor needs to be protected from these voltage peaks, otherwise it will be destroyed. Many solid-state relays are equipped with protective suppressor circuits at the output, but these often only provide protection against very small inductive loads. Therefore, when switching inductive loads with solid-state relays, it is highly recommended to have an additional external protective suppressor circuit parallel to the load. This is especially important if inductive loads are to be switched with a frequency faster than 0.5 Hz. When switching inductive loads faster than 5 Hz, specially designed solid-state relays should be used.

Effective protection of outputs of relay modules and solid-state relays

Selection criteria for the protective suppressor circuit of inductive loads

In our selection tables we specified the maximum recommended switching currents for inductive loads without protective circuits. If you want to increase the service life of the contacts, you must equip the relay contacts with an effective protective circuit.

The protective circuit on the coil side of a relay module can, for example, be implemented with an integrated or additionally pluggable freewheeling diode. However, this only protects the controlling periphery from the voltage peaks that occur in the coil of the relay module. The relay contact is usually not sufficiently protected against the voltage peaks of the inductive load to be switched, although with optimum dimensioning almost the same values for switching capacity or switching cycles can be achieved as with resistive load.

The largest reduction factor for the service life of a relay contact is the arc generated during switching off inductive loads. It is caused during the switching process by the energy stored in the coil and can destroy the contact through material evaporation and material migration.

With DC voltage and standing arc, the relay can even fail during the first switching cycle. Voltage peaks caused by electric arcs can reach values up to several 1,000 volts.

A protective circuits must be used to suppress the formation of electric arcs.

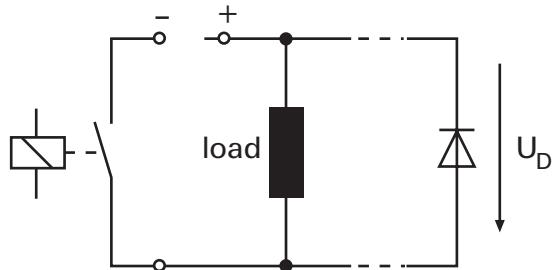

In the following, we will explain the correct installation of the protective circuit and the effectiveness of the most common types of protective circuit. There are various ways to install an effective protective circuits. For example, the protective circuit can be mounted either parallel to the relay contact or parallel to the load.

However, the protective measure should always apply directly to the source of the fault. Therefore, the protective circuit of the load is preferable to the circuit of the contact.

Advantages of a protective circuit at the load:

- When the contact is open, the load is still galvanically isolated from the operating voltage
- The switch-off peaks of the load cannot be coupled into the control lines running in parallel

Free-wheeling diodes

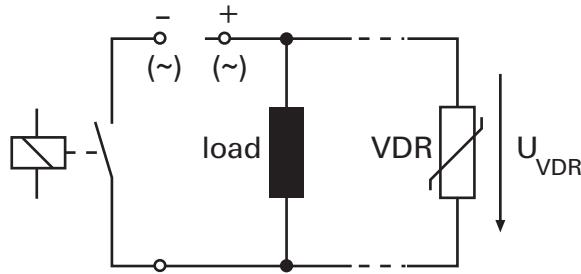

Free-wheeling diodes are used to protect against overvoltages caused by self-induction when an inductive DC voltage load is switched off (e.g. solenoid valves or electric motors). They ensure that the voltage peaks that occur are reduced to the value of the diode forward voltage (U_D). However, this leads to a delay in the voltage drop and thus in the switch-off process of the load.

Advantage:

- Uncritical dimensioning
- Very positive effect on the service life of the contacts

Disadvantage:

- Significantly extended switch off process
- Only suitable for DC voltage

Varistors

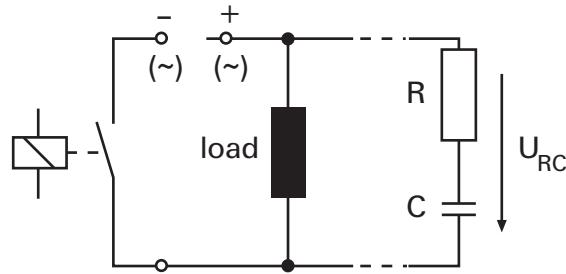

The functional principle of varistors is also based on breakdown voltages (UVDR). High energies can be dissipated, but this causes the component to aging. Therefore, the breakdown voltage is reduced over time and the leakage current is increased.

Advantage:

- Uncritical dimensioning
- Suitable for DC and AC voltage
- Slightly extended switch off process

Disadvantage:

- Complex and expensive with increasing power
- Low effect on the service life of the contact

RC modules

With RC modules, voltage peaks are compensated via a capacitor. Thanks to its special characteristics during charging and discharging the interference pulses are already filtered out during the voltage rise and not only when the breakdown voltage (URC) is reached.

Advantage:

- Suitable for DC and AC voltage
- Slightly extended switch off process

Disadvantage:

- Exact dimensioning required
- High inrush current
- Low effect on the service life of the contact

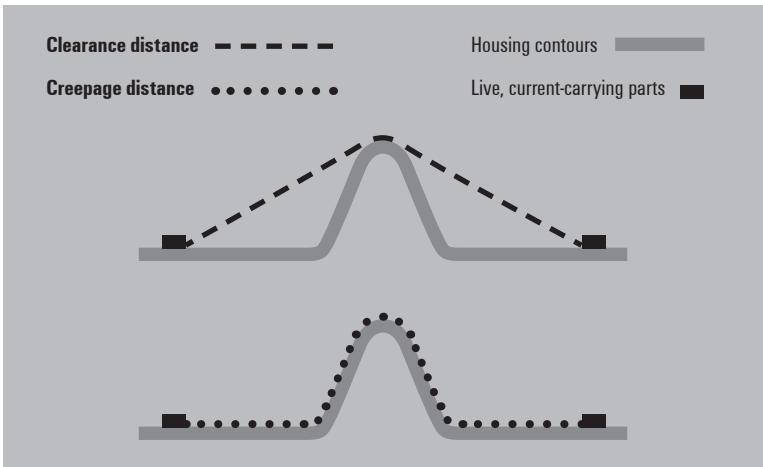

Glossary: Relay modules and Solid-state relays

		for EMR	for SSR
A			
AC switching capacity (resistive), max.	Calculated product for resistive loads from switching current and switching voltage in VA. When switching inductive loads, it is recommended to reduce the switching capacity in order to achieve the longest possible service life. The reduction results from the arc, which is significantly stronger when switching inductive loads than when switching resistive loads.	x	
Approvals and testing marks	The test marks are a way for independent (official or private) approval bodies and testing institutions to confirm compliance with the respective regulations and/or compliance with specified product properties. Note: If any approval-relative technical data is missing from the data sheet, it is available on request. Approvals that we offer for Weidmüller relay modules and solid-state relays, depending on the variant: CSA Canadian Standards Association, Canada DNV-GL Classification society made up of testing bodies Det Norske Veritas and Germanischer Lloyd, Norway EAC Eurasian Conformity for the Eurasian Economic Union, Russia TÜV Technischer Überwachungs-Verein [German Technical Inspectorate], Germany cURus Component Recognition Mark from UL (Underwriters Laboratories, Inc.) for the USA and Canada cULus Component Listing Mark from UL (Underwriters Laboratories, Inc.) for the USA and Canada VDE VDE Testing and Certification Institute, Germany (expert reports with production monitoring)	x	x
B			
B10 and B10d	The B10 value indicates the nominal service life at which 90% of the tested relays are still working. This is therefore the average number of switching cycles after which 10% of the relays fail. This value is a statistically expected value, which has been determined on the basis of endurance tests. In real applications, the service life values differ from the B10 value, because every load is different and the service life is affected by environmental parameters such as temperature, mounting position and also the switching frequency. This value is only suitable for purely theoretical failure probability calculations (see item entitled "MTTF") and is not a guaranteed service life. As the values are heavily dependent on the load and the environmental parameters, we do not specify these values in the data sheet for standard relays, and only provide them on request.	x	

EMR = Electromechanical relay
SSR = Solid-state relay

		for EMR	for SSR
Bistable relay, impulse relay, remanence relay	<p>A relay is called bistable if its contacts can assume two different stable switching states when de-energised. This means that once the contact has changed its switching position due to the energising parameter (input voltage), it remains in its switching position after the energising parameter is switched off. A further energising process is required in order to change the switching position.</p> <p>Impulse relay: A bistable relay that remains in an energised state due to mechanical interlock is called an impulse relay. Impulse relays switch over to the other switching state during an energising pulse and maintain this state until the next pulse.</p> <p>Remanence relay: A bistable relay that remains in an energised state due to remanence after the energising variable is switched off is called a remanence relay.</p> <p>To switch over to the other switching state:</p> <ul style="list-style-type: none"> • Apply a voltage to a second coil • Apply a voltage with opposite polarity for relays with only one coil 	x	
Bounce (chatter)	An unintended phenomenon that may occur in electromechanical relays, during the closing or opening of a contact circuit when the contact elements touch and separate again before they have reached their final positions. Solid-state relays do not exhibit this behaviour because they switch electronically, meaning that no mechanical bouncing can occur.	x	
Bounce times	The time (average value) between the first and last closing (or first and last opening) of a relay contact. These times are valid when the rated voltage is used for excitation without any other components connected in series or in parallel to the coil, and at the reference room temperature (approx. 23°C).	x	
C			
CE	Abbreviation for Communauté Européenne (the European Community). Manufacturers use the CE label to confirm that their products comply with the corresponding EC directives and the "essential requirements" therein.	x	x

EMR = Electromechanical relay
SSR = Solid-state relay

		for EMR	for SSR
Clearance and creepage distances	<p>Clearance and creepage distances are critical factors which influence the insulation capability of electrical components. The creepage distance denotes the minimum clearance that two live parts along a surface must have in order to prohibit a flow of current across the insulating material at the specified operating voltage.</p> <p>In addition to the operating voltage, the choice of insulating material (material group) and the protective measures to counteract pollution (pollution severity) affect the creepage distance. The clearance distance denotes the minimum direct clearance (through the air) that two live parts must have to one another in order to prohibit a charge passing through the air (an arc). The expected surge voltage (rated impulse voltage) forms the basis for calculating the distances. The surge protection category and pollution severity are further factors that influence dimensional design considerations.</p> 	x	x
Coil resistance	<p>Ohmic resistance (direct current resistance) of a relay coil measured at room temperature (approx. 23 °C) and coil temperature equal to room temperature. For AC coils, only the ohmic resistance is specified in the data sheet. The impedance, which can be calculated from the inductive resistance (reactance) and the ohmic resistance, only occurs during operation of AC coils and is considerably greater than the specified ohmic resistance. Therefore, the information in the data sheets for AC coils is not suitable for calculating the rated current of the coil.</p> <p>The coil resistance is heavily dependent on the coil temperature, which is influenced by parameters such as the ambient temperature, the rated control voltage and the duty cycle. Therefore, the values in the application may differ from the data sheet specifications.</p> <p>The coil resistance is only specified for relays and relay modules that have no other electronic components upstream from the coil. These types of inputs with upstream circuitry do not allow for reliable resistance data in the data sheet. For this reason, no resistance is specified in the data sheet for these inputs or for solid-state relays.</p>	x	

EMR = Electromechanical relay
 SSR = Solid-state relay

		for EMR	for SSR
Combination of relay and relay socket, insulation requirements and thermal characteristics	<p>Even if the socket or relay itself already meets (or surpasses) the insulation requirements, there may still be reduced clearance and creepage distances (and thus reduced insulation rated voltage) for the combination of the relay and socket.</p> <p>Restrictions – such as a reduced voltage range or reduced pollution degree – should be expected for the relay/socket combination. This is especially important for miniature multi-pole relays in combination with sockets, which have minimal gaps between the contact circuits.</p> <p>In addition to the insulation properties, the thermal properties of the combination are highly significant (see item entitled "Derating curve"). The relay sockets from different manufacturers cannot be compared directly, which is why the technical specifications are only guaranteed for approved combinations. Possible risks of fire or reduced dielectric strength may result when non-approved combinations are in use.</p> <p>Note: We only confirm the properties for the approved combinations of Weidmüller relays and Weidmüller sockets as specified in the catalogue and data sheets.</p>	x	x

		for EMR	for SSR
Contact material, Contact materials	<p>Relay modules are used in a wide variety of industrial areas and environments. The relays must therefore be adapted to the various tasks by selecting suitable contact materials. The following applies: the load capacity of the contacts for voltage, current, and power depends essentially on the material used. To make the selection easier for you, we have compared the most important characteristics of the contact materials.</p> <p>Criteria for the selection of the contact material:</p> <ul style="list-style-type: none"> • Welding tendency • Burn-off resistance • Contact resistance • Material migration • Resistance to harmful gas atmospheres <p>Material: Silver-nickel (AgNi)</p> <p>Characteristics:</p> <ul style="list-style-type: none"> • Higher welding tendency than AgSnO and AgCdO • High burn-off resistance • Lower contact resistance than AgSnO and AgCdO • Mean material migration • Low resistance to harmful gas atmospheres <p>Recommended applications:</p> <ul style="list-style-type: none"> • Suitable for low to high resistive and low inductive loads (solenoid valves, fans, heaters) • Standard contact material for a variety of relays • Limited suitable for high inrush currents • Suitable for loads > 12 V/10 mA or 5 V/100 mA <p>Material: Silver-nickel flash gold plated (AgNi + 0,15 Au)</p> <p>Characteristics:</p> <ul style="list-style-type: none"> • Higher welding tendency than AgSnO and AgCdO • High burn-off resistance (gold just storage protection) • Lower contact resistance than AgSnO and AgCdO • Mean material migration • Low resistance to harmful gas atmospheres <p>Recommended applications:</p> <ul style="list-style-type: none"> • Suitable for low to high resistive and low inductive loads (solenoid valves, fans, heaters) • The flash gold plating is a storage protection, but offers no functional improvement to AgNi • Limited suitable for high inrush currents • Suitable for loads > 12 V/10 mA or 5 V/100 mA 	x	

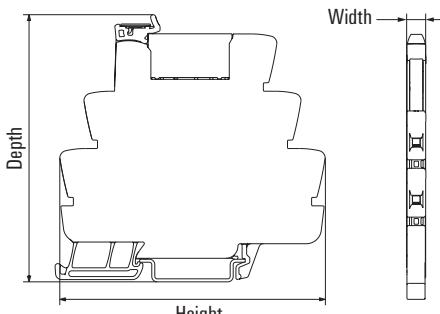

EMR = Electromechanical relay
 SSR = Solid-state relay

		for EMR	for SSR
Contact material, Contact materials (Continuation)	<p>Material: Silver-nickel hard gold plated (AgNi + Au)</p> <p>Characteristics:</p> <ul style="list-style-type: none"> • Very low resistance to burn-off • Lowest contact resistance • High resistance to harmful gas atmospheres <p>Recommended applications:</p> <ul style="list-style-type: none"> • Suitable for decoupling control inputs and other small resistive loads • Suitable for loads > 1 V/1 mA and < 30 V/10 mA • After switching loads > 30 V/100 mA, small powers can no longer be switched reliably because the hard gold plating has been burned-off. Only the characteristics of the base contact material AgNi still apply. <p>Material: Silver-Tin-Oxide (AgSnO)</p> <p>Characteristics:</p> <ul style="list-style-type: none"> • Lower welding tendency than AgNi und AgCdO • High resistance to burn-off • Average contact resistance • Lower material migration than AgNi and AgCdO • Very low resistance to harmful gas atmospheres <p>Recommended applications:</p> <ul style="list-style-type: none"> • Suitable for medium to high resistive DC-loads and low up to medium inductive DC loads due to low material migration. Thanks to the low tendency to weld, it is also well suited for loads with higher inrush currents such as lamp loads, light capacitive loads, fluorescent tubes, etc. • Suitable for loads > 12 V/100 mA <p>Material: Silver-Cadmium-Oxide (AgCdO)</p> <p>Characteristics:</p> <ul style="list-style-type: none"> • Lower welding tendency than AgNi • High resistance to burn-off • Average contact resistance • Lower material migration than AgNi • Very low resistance to harmful gas atmospheres <p>Recommended applications:</p> <ul style="list-style-type: none"> • Suitable for medium to high resistive and inductive AC loads, due to high burn-off resistance • Suitable for loads > 12 V/100 mA <p>Material: Tungsten (W)</p> <p>Characteristics:</p> <ul style="list-style-type: none"> • Lowest welding tendency • Very high resistance to burn-off • Highest contact resistance • Low material migration <p>Recommended applications:</p> <ul style="list-style-type: none"> • Suitable for loads with very high inrush currents of up to 165 A/20 ms or 800 A/200 µs (e.g. lamp loads, capacitive loads, fluorescent tubes, switched-mode power supplies etc.) • Often used as a pre-making contact in parallel to AgSnO contacts 	x	

EMR = Electromechanical relay
SSR = Solid-state relay

		for EMR	for SSR
Contact resistance	Electrical resistance between the closed relay contacts. In most applications, the contact resistance does not play a significant role in the reliability of a relay. However, a low contact resistance can only be reliably achieved above a certain load (see item entitled "Contact material" or "Minimum switching capacity"). With very small loads, significantly higher contact resistances can occur, especially with switching voltages below 30 V and switching currents below 10 mA. In such cases, it is recommended to use hard gold-plated contacts. After the relay has been operated in a permanently off or on state for several days (e.g. due to adverse environmental conditions such as harmful gas atmospheres) or after it has been stored, it is recommended that a certain number of cycles be performed before measuring the contact resistance. This is achieved by means of electrical cleaning, which can be performed by switching a sufficient load and by self-cleaning caused by contact friction during the switching process.	x	
Contact welding, Adhesive bonding (contacts) Capacitive loads	Often occurs due to excessive inrush currents, e.g. when switching capacitive loads. See also the item entitled "Inrush currents". However, this can also occur when switching loads without high inrush currents, although this will often be at the end of the contact's service life. This happens due to material peaks on the contour surfaces which are caused by material migration and/or combustion. These material peaks then merge during the switch-on process, since the current of the load is conducted via this small contact point, which then leads to a brief but strong temperature increase that can weld the contacts.	x	
Continuous current	Current that can be carried continuously without exceeding the limit values for contact heating under certain conditions. Consider the derating curve. This current can also be switched on and off in the case of AC voltages. With DC voltages, this is only possible to a limited extent. See diagram: DC load limit curve.	x	x
Continuous operation	Operating mode in which a relay remains energised until it reaches thermal equilibrium. Unless otherwise specified, all Weidmüller relays are suitable for continuous operation.	x	x
D			
DC load switching capacity, DC load limit curve, DC breaking capacity	Values below the DC load switching capacity curve (for max. permitted switching voltage/current at resistive load) can be switched on and off reliably; e.g. an arc is extinguished (max. arc duration is 10 ms at resistive load). The position and shape of the load-limit curve is influenced by the contact material and relay construction (contact gap, opening speed of the contacts, etc.) The DC breaking capacity can be increased by connecting relay contacts in series. This is shown with dashed lines in the DC Load Limit Curves diagrams, if specified. For further information, please refer to the item entitled "Series connection of relay contacts". Information about the electrical lifespan should not be derived from these curves!	x	
DC switching capacity (resistive), max.	Calculated product for resistive loads from continuous current and switching voltage in W. When switching inductive loads, it is recommended to reduce the switching capacity in order to achieve the longest possible service life. The reduction results from the arc, which is significantly stronger when switching inductive loads than when switching resistive loads. The specified switching capacity refers to 24 V DC switching voltage. For other DC switching voltages, refer to the DC load limit curve provided in the data sheet.	x

Derating / derating curve	x	x	
<p>Flowing current causes heat, which increases with increasing current intensity. Electric components have an upper limit temperature which limits their functionality. Because the temperature influence on the components is made up of the ambient temperature and the heat generated by the current, the current must be reduced as the ambient temperature increases so as not to exceed the upper limit temperature. The relationship between the prevailing ambient temperature and the resulting maximum current is shown in the derating curve. Unless otherwise specified, the derating curves are given for the following conditions:</p> <ul style="list-style-type: none"> • Max. rated control voltage • 100% duty cycle • Resistive load • Closely packed with several identical products • Horizontally and vertically oriented terminal rail (in an upright cabinet) • No ventilation in the cabinet • No shading by cable conduits <p>The heating of the product can be increased by the following parameters, which can lead to heating above the limit temperature and therefore to damage or even destruction of the product:</p> <ul style="list-style-type: none"> • Shading, e.g. by cable conduits fitted too narrowly, which can lead to heat accumulation • High switching frequencies, especially when switching high currents or inductive loads (arcing) • Warmth from other devices mounted nearby <p>The heating of the product can be reduced by the following parameters:</p> <ul style="list-style-type: none"> • Reduction of shading by increasing the distances to cable conduits, for example • Increasing the ventilation in the control cabinet • Increasing the distance to adjacent products • Avoiding the effects of heat from other devices mounted nearby

Drop-out current, typ	<p>Typical current at which previously switched on monostable electromechanical relays and solid-state relays switch off.</p> <p>This means that this is the maximum input current value that must not be exceeded for switch-off in order to switch off the relays.</p> <p>They can also switch off at currents that are significantly higher than the specified value, since the specified value is a typical value at which they should be switched off.</p> <p>For AC, specifications are valid for 50 Hz unless otherwise indicated.</p> <p>Measured at room temperature (approx. 23 °C) and an only briefly energised input (coil temperature below thermal stability).</p> <p>The switching thresholds of electromechanical relays are strongly dependent on environmental parameters such as ambient temperature, mounting position, manufacturing tolerances (e.g. coil resistance) and the shape of the control signal. Therefore, the values in the application may differ from the data sheet specifications. The switching thresholds of solid-state relays fluctuate less, since the electronic components are less temperature-dependent than a relay coil.</p>	x	x
Drop-out voltage, typ	<p>Typical voltage at which previously switched on monostable electromechanical relays and solid-state relays switch off.</p> <p>This means that this is the maximum input voltage value that must not be exceeded for switch-off in order to switch off the relays.</p> <p>They can also switch off at voltages that are significantly higher than the specified value, since the specified value is a typical value at which they should be switched off.</p> <p>For AC, specifications are valid for 50 Hz unless otherwise indicated.</p> <p>Measured at room temperature (approx. 23 °C) and an only briefly energised input (coil temperature below thermal stability).</p> <p>The switching thresholds of electromechanical relays are strongly dependent on environmental parameters such as ambient temperature, mounting position, manufacturing tolerances (e.g. coil resistance) and the shape of the control signal. Therefore, the values in the application may differ from the data sheet specifications. The switching thresholds of solid-state relays fluctuate less, since the electronic components are less temperature-dependent than a relay coil.</p>	x	x
Duty cycle, relative duty cycle	<p>Describes the ratio of the switched-on state of a relay or solid-state relay to the total duration in intermittent, continuous or short-time operation. The duty cycle is expressed as a percentage of the total cycle duration.</p> <p>The heating of the relay can be influenced positively or negatively by the duty cycle.</p> <p>A high duty cycle leads to increased heating of the relay due to the power loss of the coil and the switching contacts.</p> <p>Unless otherwise specified, Weidmüller relay modules and solid-state relays are suitable for 100% duty cycle (continuous operation).</p> <p>With very fast switching solid-state relays, the duty cycle also affects the maximum switching frequency. This is then indicated in the corresponding diagrams in the data sheet.</p>	x	x

EMR = Electromechanical relay
SSR = Solid-state relay

	for EMR	for SSR
E		
Electrical endurance, Electrical endurance curve, contact endurance	<p>Number of switching cycles of a relay with electrical contact load under full operational capability. Unless otherwise stated, the contact data and electrical lifespan curves are valid under the following conditions:</p> <ul style="list-style-type: none"> • Measured at the NO contact • Resistive AC load • AC mains frequency 50 Hz • Duty cycle 50% • Switching frequency 0.1 Hz • Rated control voltage (coil) • Ambient temperature 23°C • Individual assembly <p>The electrical lifespan is specified according to the criteria for 'useful life', severity level B according to IEC 61810-2. The data does not cover any use beyond the specified electrical lifespan; it is the responsibility of the user to avoid such situations. Experience has shown that the electrical lifespan remains relatively constant with an AC load up to a power factor ($\cos \phi$) of 0.8. However, each load places different demands on the switching contact and other environmental factors also influence the service life of the switching contact, e.g. the type of load, the switching voltage at the contact, the switching current of the load, any inrush currents, the ambient temperature, the mounting position, the switching frequency and many more. Therefore, the real service life could be either above or below the specified value. For loads other than those specified in the service life data, it is recommended that user advice be followed; alternatively, recommendations can be found in the selection table in Chapter For critical applications it is recommended that the service life values be determined independently by the user.</p> <p>Please note: The curve for the electrical lifespan specifies the typical service life as the "Mean Cycles to Failure" (MCTF) and is based on the Weibull distribution. No guaranteed minimum values can be interpreted from this statistical data. The electrical lifespan must not be compared with the mechanical lifespan when switching larger or inductive loads, as the mechanical lifespan is measured without contact load and the failure criteria are different. The difference between the mechanical and electrical lifespans becomes greater as the switching current increases. For more information on the mechanical lifespan, see item entitled "Mechanical lifespan".</p>	x

EMR = Electromechanical relay
SSR = Solid-state relay

W

		for EMR	for SSR
Error, relay failure	<p>According to IEC 61810, a relay failure is defined as the occurrence of malfunctions that exceed a certain number:</p> <ul style="list-style-type: none"> • Malfunction when closing contacts • Malfunction when opening contacts (contact bridging in CO contact as a special form of malfunction when opening contacts) • Insufficient dielectric strength. <p>Such malfunctions must be considered in the scope of the application – they should not create any risks. Depending on the specific load and the power in the contact set, malfunctions can result in various risks such as malfunctioning of the device and its controls, electric shock and excessive heating or even fire. The user is responsible for taking the necessary precautions in accordance with the relevant regulations.</p>	x	
F			
Flammability according to UL	Indicates the flammability class according to the specification from UL 94 (Underwriters Laboratories, Inc., USA). Flammability tests according to UL 94: for testing plastic materials and classifying the propagation/extinction characteristics when the material burns. The UL 94 flammability classes which are relevant to relays are V-0, V-1, V-2 and HB.	x	x
G			
Galvanic isolation	Potential-free isolation between electrical components. Electrical (or galvanic) isolation means that no charge can flow from one circuit to another. There is no conductive electrical connection between the circuits. The circuits can nevertheless exchange electrical power or signals via magnetic fields, infrared radiation or by charge displacements.	x	x
H			
Humidity, relative humidity, condensation	<p>Ratio between the actual and the maximum possible mass (quantity) of water vapour in the air - Unit: %</p> <p>When storing or operating under other conditions, steps must be taken to avoid temperature changes/shocks which could cause icing or condensation.</p> <p>The plastic used in the products can expand due to high humidity and contract due to low humidity, which can lead to increased insertion and pulling forces of cross-connections and other accessories.</p>	x	x
I			
Impulse withstand voltage	Amplitude of a voltage pulse of short duration with a specific pulse shape (e.g. 1.2/50 µs) and polarity, which is used to test insulation paths in a product.	x	x

EMR = Electromechanical relay
SSR = Solid-state relay

		for EMR	for SSR
Inrush current (output)	<p>The highest value of current that can be switched on by an output of a relay module or solid-state relay.</p> <p>This current is specified along with a time for which it can be carried.</p> <p>The inrush current for some loads can be considerably higher than the specified rated current. Loads with a capacitive load component, especially LED lamps, place extreme demands on the switching contacts regardless of the type of voltage. They have extremely high-energy current peaks at the moment of switch-on. These can reach over 100 A and can weld the contact right from the first switch-on.</p> <p>Therefore, when selecting the relay, consideration must be given as to whether high inrush currents will be generated by the load being switched.</p> <p>Potential loads with high inrush currents are:</p> <ul style="list-style-type: none"> • Lamp loads, especially LED lamps • Power supplies • Loads with wide-range inputs (e.g. with control voltages of 110-230 V AC/DC) such as solenoid valves and contactors • Loads with other special input circuits such as energy-saving circuits • Motor loads with high starting torques, e.g. gears • Servomotors <p>For these types of loads, it is recommended that special relay couplers (e.g. relay modules with tungsten pre-run contact) be avoided.</p> <p>Furthermore, solid-state relays are also very well-suited to high but short inrush current peaks, as they do not contain any mechanical components and therefore cannot fail.</p>	x	x
Instantaneous switching	<p>Solid-state relays with AC outputs such as triacs or thyristors which switch on immediately on switch-on and switch off at the zero crossing of the switching current. For this reason, switching off may be delayed depending on the phase position at the time of switching and on the mains frequency of the switching current.</p> <p>Signal characteristics of instantaneous switching PSSR shown at an example with resistive load</p> <p>$t_{on\ max} \leq 0.1\ ms$ $t_{off\ max} \leq 10\ ms$</p>	x	

EMR = Electromechanical relay

		for EMR	for SSR
Insulating material group	<p>According to their CTI (comparative tracking index) values, the insulating materials are categorised in one of the following four groups:</p> <p>Group I 600 CTI Group II 400 CTI < 600 Group IIIa 175 CTI < 400 Group IIIb 100 CTI < 175</p> <p>The figures for the comparative tracking index, according to IEC 60112 (DIN IEC 60112 / DIN VDE 0303-1) are determined using special samples prepared for this purpose with test solution A.</p>	x	x
L			
Leakage current	<p>The current on the load side of a solid-state relay that flows when the output stage is in the locked state. It flows because a solid-state relay does not provide galvanic isolation of the output, as is the case when there is an air gap when the contact of an electromechanical relay is open. The output of a solid-state relay only becomes high-impedance when it is locked, meaning that only a very small amount of current is flowing. Solid-state relays with AC output often have an RC protective suppressor circuit in parallel to the output, which is why leakage currents of up to 2 mA can flow in the locked state.</p>	x	
Load limit integral (I^2t)	<p>The load limit integral (I^2t), specified in A^2s, is the pulse-shaped (< 10ms) short-term overload capacity of the semiconductor switch in solid-state relays or semiconductor contactors.</p> <p>It is used to select a fuse as device protection for the output of a semiconductor switch.</p> <p>If this value is exceeded, the semiconductor switch may be destroyed; when selecting the fuse size, it is therefore recommended that the I^2t of the fuse is half the size of the semiconductor switch.</p>	x	
M			
Max. reset time in the case of a voltage interruption, recovery time	<p>Time that needs to elapse after the excitation variable has been switched off in order for the timing relay to fulfil a function again as specified.</p>	x	x
Max. switching frequency (DC and AC control voltage)	<p>Number of switching cycles per time unit of a solid-state relay with continuous current and resistive load.</p> <p>When switching inductive loads with switching frequencies faster than 0.5 Hz, an external protective suppressor circuit must be connected in parallel with the load.</p> <p>If this is not possible, solid-state relays specially designed for switching inductive loads must be selected.</p> <p>Due to the input wiring of the solid-state relay (e.g. bridge rectifier and smoothing capacitor), different switching frequencies can often be implemented for solid-state relays with AC/DC (UC) input. These specifications are therefore listed separately in the data sheet.</p>	x	
Max. switching frequency at rated load	<p>Number of switching cycles per time unit of an electromechanical relay at max. switching capacity and resistive load.</p> <p>The switching frequency for small and medium loads can be higher than the value specified in the data sheet if the switching characteristics of the load (such as arcing) do not overload the contact to an impermissible extent.</p>	x	

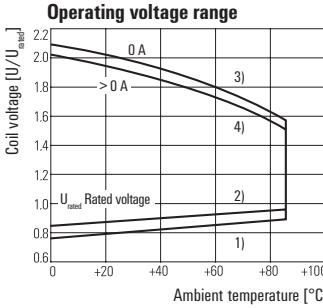

EMR = Electromechanical relay
 SSR = Solid-state relay

		for EMR	for SSR
Mechanical service life	The number of switching cycles for current-free relay contacts for which the relay must remain functional under specific conditions. Although the mechanical lifespan is determined without a contact load, it can give an indication of the electrical lifespan with contact loads less than 100 mA (resistive load). The mechanical lifespan must not be compared with the electrical lifespan when switching larger or inductive loads, as the mechanical lifespan is measured without contact load and the failure criteria are different. The difference between the mechanical and electrical lifespans becomes greater as the switching current increases. For more information on the electrical lifespan, see item entitled "Electrical lifespan".	x	
Mechanical switch position indicator	Plastic lever inside some electromechanical relays, which is mechanically connected to the armature. The switching position of the relay armature can therefore be seen through an inspection window in the relay cover.	x	
Min. pulse duration	Shortest required period for the start impulse to start the time function of a timing relay.	x	x
Min. switching current	Specifies the minimum switching current of the output of a semiconductor switch. A semiconductor output, in particular triacs and thyristors, requires a minimum load current to open and close reliably.		x
Minimum switching capacity	The calculated product of the switching current and switching voltage – a measure of reliable switching. Low contact resistance values are only achieved above a certain power, because when switching loads above this power, a sufficient arc is generated that burns away or breaks through oxidation layers and dirt (electrical cleaning). Greatly increased resistances may occur at lower switching loads, which can prevent the load circuit from being reliably switched. The switching voltage has a greater effect than the switched current when switching small powers, because the formation of an arc is more dependent on the switched voltage than on the switched current. The minimum contact loads for different contact materials should also be taken into account. (see item entitled "Contact materials") By switching regularly (at least several times a day), it is also possible to switch powers below the minimum contact loads of the various contact materials (except for hard gold-plated contacts). This is achieved by the self-cleaning effect caused by contact friction during the switching process. The minimum switching capacity can be negatively affected by harmful gas atmospheres in the ambient air.		x
Mono-stable relay	A relay is referred to as mono-stable when its contacts return to the state of rest automatically after the energising parameter (the input voltage) is switched off.	x	x

EMR = Electromechanical relay
 SSR = Solid-state relay

		for EMR	for SSR
Mounting distance	<p>Distance between two adjacent components when using parallel, same orientated positioning; or the distance to other electrical components, e.g. on a terminal rail. Because of the insulation requirements or the self-heating (derating) it may be necessary to increase the minimum gap between the components or select a different positioning. Self-heating can be improved by increasing the mounting distance. This can help to reduce the derating of the switching current. In addition to this definition, the following applies:</p> <ul style="list-style-type: none"> • Densely packed installation: Designed with minimum mounting distance to products from the same Weidmüller product series. Unless otherwise stated, from the point of view of self-heating, Weidmüller relay modules and solid-state relays are suitable for densely packed installation with other products from the same Weidmüller product series. It is recommended that there should be a mounting distance between these and other components from other Weidmüller product series or components from other manufacturers, as this can lead to a reduction in the insulation properties or to an unacceptable increase in self-heating. • Individual installation: components are mounted with gaps so that there are no thermal influences from adjacent components. 	x	x
Mounting position	<p>Electromechanical relay modules and solid-state relays (SSR) from Weidmüller can be installed in almost any position unless otherwise specified in the data sheet. The mounting positions used in the industrial environment are: mounted on a terminal rail in a horizontal or vertical installation position in an upright control cabinet. These positions are also checked when determining the derating curves. However, the most common method of installation is on a horizontally aligned terminal rail. It is not recommended to install the relays upside down (relay pointing downwards) as this is not taken into account when determining the derating curves. This would also lead to heat accumulation and the risk of a pluggable relay slipping out of the socket due to vibrations. To ensure the proper current flow and heat dissipation, the connections must have adequate cross-sections. Several factors must be taken into consideration when positioning: including the insulation requirements, heat dissipation and the possible mutual magnetic and thermal influence.</p>	x	x
MTTF	<p>MTTF is the abbreviation for Mean Time To Failure and is also designated as the mean operating service life. For relay modules and solid-state relays, the MTTF value is equal to the MTBF because no repair is performed on the products. They are replaced after a defect, which means that there is no repair time.</p> <p>The MTTF value of relay modules is calculated on the basis of the B10 value (see item entitled ""B10 value""") and the switching cycles occurring in the application. It can be calculated using the following formula for electromechanical relays:</p> $\text{MTTF} = \text{B10} \div (0.1 \times n)$ <p>The value "n" is the number of annual switching cycles in the application. The user must enter this value together with the appropriate B10 value in the formula in order to calculate the possibility of failure of the relays used in the application.</p> <p>The MTTF value of solid-state relays is calculated using the parts counting method, based on the basic failure rates from SN29500. This is possible because a solid-state relay is not subject to mechanical wear, meaning that the statistical failure values of the individual components within the solid-state relay can be added together. Electrical connections and plug-in connections were not taken into account when calculating the values specified in the data sheet.</p> <p>The failure rates of electronic components increase considerably after approx. 8 to 12 years, causing the MTTF values to decrease (see EN 61508-2: 2011-02, 7.4.9.5, Note 3).</p>	x	x

Pollution severity level	<p>Pollution (contamination) includes any foreign material – whether it is solid, liquid or gaseous (ionised gas) – which is capable of influencing the surface resistance of the insulating material. The standard defines four degrees of pollution. Their numbering and classification is based on the quantity of the contaminant or the frequency with which the contaminant reduces the dielectric strength and/or surface resistance.</p> <p>Pollution degree 1:</p> <ul style="list-style-type: none"> • there is no contamination or only dry occurrences of non-conductive pollution. The pollution has no influence. <p>Pollution degree 2:</p> <ul style="list-style-type: none"> • there is only non-conductive pollution. Temporary occurrences of conductivity caused by condensation may also occur. <p>Pollution degree 3:</p> <ul style="list-style-type: none"> • conductive pollution or dry, non-conductive pollution that can become conductive due to condensation is likely to occur. <p>Pollution degree 4:</p> <ul style="list-style-type: none"> • the contamination leads to continual conductivity which can be caused by contaminants such as conductive dust, rain or snow. 	x	x
Positively driven contacts	<p>Relays with positively driven contacts according to EN 61810-3 are characterised by the fact that, due to a mechanical guide, the NO and NC contacts of a relay cannot be closed at the same time.</p> <p>Design differences compared to relays with standard contacts:</p> <p>In relays with positively driven contacts, some components within the relay have a more heavy-duty design. This is the case for components such as the contact springs and the armature.</p> <p>This is in order to reduce the possibility of a dangerous failure. However, it also means that the coils in these relays need to be stronger in order to move the larger or heavier parts. As a result, these types of relays have up to twice the power consumption compared to standard relays.</p> <p>In addition, there is more insulation between the input and output and between the output channels in relays with positively driven contacts compared to standard relays of the same size.</p> <p>To use relays with positively driven contacts for safety applications, at least one of the relay's NO contacts and one of its NC contacts must be integrated into the circuit design. The NO contact of the first channel then switches the function in the safety application and the NC contact of a second channel gives a feedback signal to the control unit. This means that if one of the NO contacts welds, for example, the following function step of the application cannot be initiated and the circuit is stopped because the NC contact cannot give a feedback signal due to the fact that the NO is welded.</p> <p>The standard EN 61810-3 describes the requirements for relays with positively driven contacts.</p> <ul style="list-style-type: none"> • Type A: Type A relays only have NO and NC contacts • Type B: Type B relays have CO contacts; in applications where the positively driven contact function is to be used, only the NO or NC contacts of a CO contact may be used. 	x

Power rating (input)	<p>The nominal value of the power that is converted when the rated control voltage is applied in individual installation.</p> <p>For AC, specifications are valid for 50 Hz unless otherwise indicated.</p> <p>Measured at room temperature (approx. 23 °C) and an only briefly energised coil (coil temperature below thermal stability).</p> <p>The power rating depends on environmental parameters such as the ambient temperature, the mounting position and the manufacturing tolerances (coil resistance). Therefore, the values in the application may differ from the data sheet specifications.</p>	x	x
Protection degree – (IEC 60529), IP	<p>The degree of protection afforded by an enclosure is shown using the IP Code (IP = International Protection). This information is equally relevant for industrial relays and accessories.</p> <p>Protection levels for touch contact and foreign bodies (the first digit): the first digit indicates the degree of protection inside the housing against ingress of solid foreign objects and against any human access to hazardous parts.</p> <p>0: no protection 1: protection for large body parts with a diameter > 50 mm 2: finger protection (diameter 12 mm) 3: tools and wires (diameter > 2.5 mm) 4: tools and wires (diameter > 1 mm) 5: full protection against touch contact 6: full protection against touch contact</p> <p>Degree of water protection (the second digit)</p> <p>Degrees of protection: water protection (2nd digit)</p> <p>The second digit indicates the degree of protection provided against the ingress of water into the housing:</p> <p>0: no protection 1: protection against vertically falling drops of water 2: protection against water droplets falling diagonally (up to 15°) 3: protection against water spray that falls at an angle up to 60° from vertical 4: protection against splashed water from all sides 5: protection against water jets 6: protection against powerful jets of water (flooding) 7: protection against sporadic submersion 8: protection against constant submersion</p>	x	x

EMR = Electromechanical relay

SSR = Solid-state relay

	for EMR	for SSR
Protective circuit on the control side (solid-state relay) or protective circuit (electromechanical relay) at the input	<p>The protective suppressor circuit at the input can either be plugged into the socket by a plug-in module or it can be integrated into the electromechanical relay or the solid-state relay. The various protective suppressor circuits and their function are explained below:</p> <p>Free-wheeling diode: Protects only the control electronics from the inductive cut-off voltages of the relay coil of an electromechanical relay with DC coil. Attention: If no additional reverse polarity protection has been previously installed, a short circuit can be caused by reverse polarity.</p> <p>Varistor: Protects the input of an electromechanical relay or solid-state relay from surge voltages. In electromechanical relays, it also protects the control electronics from the inductive cut-off voltages of the relay coil.</p> <p>Rectifier: Enables AC and DC voltages to be connected as a protective suppressor circuit in the input without prescribing a polarity direction. In electromechanical relays, it also protects the control electronics from the inductive cut-off voltages of the coil.</p> <p>RC element: Protects the control electronics from the inductive cut-off voltages of the relay coil of an electromechanical relay with AC coil. Coupled voltages in long control lines at the input may mean that an electromechanical relay or solid-state relay no longer switches off reliably. An RC element allows for the reduction of the coupled voltages, which can cause the electromechanical relay or solid-state relay to drop out.</p>	x x
Protective circuit, load side (solid-state relay)	<p>Protective suppressor circuit integrated in the output of the solid-state relay. The protective suppressor circuit at the output of a solid-state relay protects the output against surge voltages such as those that occur when switching off inductive loads.</p> <p>Due to the very compact design of pluggable solid-state relays such as those used in the TERM SERIES as well as the limited heat dissipation, the protective suppressor circuit of these solid-state relays often only offers protection against small surge voltages, e.g. from very light inductive loads.</p> <p>It is therefore highly recommended to have an additional external protective suppressor circuit parallel to the load when switching inductive loads with these pluggable solid-state relays. Otherwise, the semiconductor output may be destroyed.</p> <p>When switching inductive loads with switching frequencies faster than 0.5 Hz, an external protective suppressor circuit must be connected in parallel with the load. If this is not possible, solid-state relays specially designed for switching inductive loads must be selected.</p>	x

Relay times (time response) electromechanical relays	<p>Because of the self-inductance of the coil and the inertia of the moving parts, the steps involved in operating a relay do not occur instantaneously. The following chart illustrates several time-function terms for the main contact variants of non-delayed switching relays.</p>	x
Repeat accuracy	Difference between the highest and lowest time range values for several measurements of a timing relay's time response under identical conditions. The value is given as a percentage of the mean value of all measured values.	x x
Rest position	The switched position of a mono-stable relay in its de-energized state.	x
RoHS Directive	<p>RoHS stands for "Restriction of (the use of certain) Hazardous Substances". According to the EU Directive 2002/95/EC from 01.07.2006, all EU member nations must forbid the use of hazardous substances which damage human health and the environment (including mercury (Hg), cadmium (Cd), lead (Pb), hexavalent chrome (Cr6), polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE)) in new electrical and electronic devices.</p> <p>The term "compliant" means that the entire product group meets the requirements of the RoHS Directive.</p>	x x

EMR = Electromechanical relay
SSR = Solid-state relay

		for EMR	for SSR
S			
Schmitt trigger	Strictly speaking, switching voltages for digital control follow an analogue pattern (no changeover from 0 to 1 between maximum and minimum voltages). This can lead to inaccuracies in switching results, above all when signals are being transmitted rapidly. In this case, the Schmitt trigger functions as a threshold switch. If the threshold voltage set in the Schmitt Trigger is exceeded, the output assumes the maximum possible output voltage (logic 1). Otherwise it is the minimum possible output voltage (logic 0). The Schmitt trigger is normally designed with a hysteresis. The threshold voltage set for activating is higher than that for deactivating. That prevents small irregularities from triggering a switching operation.	x	
Self-heating	The heating up of an operational component based on the power loss from the relay coil and the switching contacts.	x	
Self-heating, power loss	The heating up of a relay module or solid-state relay during operation due to the power consumption of the input and the power loss from the switching contacts. The standard DIN EN 61439 "Low-voltage switchgear and controlgear assemblies - Part 1: General rules" requires that the heating up of a switching combination be determined for planners, panel builders and installers. The power loss of all installed equipment must be taken into account. However, this presupposes that the respective manufacturers of the equipment make the corresponding values available. In practice, determining the actual power loss for certain equipment is difficult and only possible with a lot of effort. This also includes electromechanical relays and relay modules. We would like to provide you with a simple recommendation to help calculate these power loss values for Weidmüller relay modules and solid-state relays.	x	x
Self-heating, power loss	Power loss in electromechanical relays: The power loss of a relay module can be calculated by adding the input power specified in the data sheet to the output power loss. If you want to determine the real power loss for the output, this depends on a number of parameters such as switching current, switching frequency, ambient temperature, arcing time, etc. Performing the calculation using all these values would be almost impossible, because many of these parameters are not known. Therefore, we recommend calculating the power loss at the output using a highly simplified formula of contact resistance and switching current: $P = I^2 \times R$ The contact resistance is dynamic during the service life, and increases due to wear, e.g. contact erosion towards the end of the service life. Weidmüller recommends using 50 mOhm (0.05 Ohm) as the contact resistance for calculating the output power loss of a relay module. It is not recommended to measure the contact resistance with a multimeter, because this can give completely incorrect values. For the maximum power loss, simply insert the continuous current from the data sheet into the formula. To calculate a value that is closer to the real power loss, it is recommended to insert the actual current switched in the application into the formula. These formulas calculate the power loss for 100% duty cycle. If you now want to determine the value more accurately, the power loss should be multiplied by the duty cycle (in per cent). With a duty cycle of 50%, the power loss would be halved.	x	

EMR = Electromechanical relay
 SSR = Solid-state relay

		for EMR	for SSR
Self-heating, power loss	<p>Power dissipation in solid-state relays:</p> <p>The power loss calculation in solid-state relays behaves in almost the same way as that of electromechanical relays. Here, however, the maximum voltage drop specified in the data sheet is used instead of the contact resistance. This voltage drop is essentially dependent on the switched current. At low switching currents, the voltage drop is low, but it is recommended to use the maximum voltage drop from the data sheet. The highly simplified formula is then as follows:</p> $P = U \text{ voltage drop} \times I$ <p>For the maximum power loss, simply enter the continuous current from the data sheet into the formula. In order to calculate a value that is closer to the real power loss, it is recommended to insert the actual current switched in the application into the formula</p> <p>These formulas calculate the power loss for 100% duty cycle. If you now want to determine the value more accurately, the power loss should be multiplied by the duty cycle (in per cent). With a duty cycle of 50%, the power loss would be halved.</p>		x
Series-circuit connection of relay contacts	<p>The serial connection of 2 or more NO contacts of a relay causes the contact opening to increase on switch-off. Arcs which occur from DC loads are cleared more quickly which results in reduced burn-off on the contact. This increases the electrical endurance or the possible switching current or switching voltage. The possible switching current or the possible switching voltage is shown with dashed lines in the DC load limit curves diagrams, if specified. Information about the electrical endurance should not be derived from these curves!</p>		x
Setting tolerance	<p>Difference between the measured value of the delay period and the set value on the time relay.</p> <p>The specification refers to the full scale value.</p> <p>The setting tolerance is measured directly at the relay contacts, i.e. a time is set using the scale on the device and then measured.</p> <p>The input signal (start of time measurement) is either the power supply or the control contact, depending on the definition of the function.</p> <p>The time measurement is ended by switching the output contact.</p>	x	x
Short-circuit-proof	<p>Switching off the output stage of some solid-state relays whose output was developed to be short-circuit proof in order to protect the output circuit from damage in the event of a short circuit.</p> <p>Solid-state relays without a special design in the output are not short-circuit proof and must be protected with a special fuse for device protection. A short-circuit-proof output does not release the user from the obligation to install line protection to protect the installation.</p>		x
SIL	<p>Safety Integrity Level. To reduce risk, the components must comply with the requirements of IEC 61508. This standard provides general requirements for avoiding and minimising device and equipment outages. It stipulates organisation and technical requirements concerning device design and operation. Four safety levels are distinguished for systems and risk-reducing measures, ranging from SIL1 for low risk to SIL4 for very high risk. Measures taken to reduce risk must be more reliable when the classified risk level is higher.</p>	x	x
Solid state contactor, Power Solid-State Relay (PSSR)	<p>A solid-state relay that can switch a high level of power, which is why they are called semiconductor contactors or PSSR (Power Solid-State Relays).</p> <p>They are considerably larger than conventional solid-state relays and often have a heat sink, which is needed in order to remove the power loss in the output.</p>		x

EMR = Electromechanical relay
 SSR = Solid-state relay

Standardised labelling of connections	<p>Connection designation according to EN 50005: The connections are defined by a two-digit code: A1 and A2 are used for the connections of the input or the coil For inputs of time relays which have connections for triggering the time function (control input), these are designated B1.</p> <p>For the connections at the output, the first number indicates the respective output channel and the second number the function. The following examples are given for a 1-channel output: NO contact: 13, 14 NC contact: 11, 12 CO contact: 11, 12, 14 (connection 11 is the common contact, i.e. the root) For relays with more than one output channel, the first number for the respective contact set is exchanged. For example, for a 2 changeover relay: 11, 12, 14 for the first CO contact and 21, 22, 24 for the second CO contact For outputs of timing relays, the function numbers change from .1 to .5, from .2 to .6 and from .4 to .8. The first CO contact is therefore designated 15, 16 and 18 for timing relays.</p> <p>Connection designation according to IEC 67: Common in the USA. In this case, the connections are numbered consecutively. A relay with 4 CO contacts therefore has the numbers 1 to 14. It should be noted that numbers 11, 12 and 14 appear in both connection marking systems but have different functions. Instead of the coil connection markings A1 and A2, the terminal markings A and B are also commonly used. However, the connection designations according to IEC 67 are being used less and less frequently, which is why they are seen on fewer and fewer relay modules.</p>	x	x
Status indicator (input)	<p>Unless otherwise described, the status indicator for relay modules and solid-state relays indicates the presence of a control voltage at the input. It does not indicate the state of the output and may deviate from the state of the output in the following cases:</p> <ul style="list-style-type: none"> • Welded/defective switching elements • Interference radiation or residual voltages on the control lines <p>At ambient temperatures > 50°C, the luminosity and service life of the LED may be reduced.</p> <p>The function of other status indicators is described in the respective documentation.</p>	x	x
Storage temperature	The permitted ambient temperature, related to a specific relative humidity level, for which the product should be stored while in a current-free state.	x	x

As experienced experts we support our customers and partners around the world with products, solutions and services in the industrial environment of power, signal and data. We are at home in their industries and markets and know the technological challenges of tomorrow. We are therefore continuously developing innovative, sustainable and useful solutions for their individual needs. Together we set standards in Industrial Connectivity.
